

# CLEAVAGE OF FUSION PROTEINS USING GRANZYME B PROTEASE

## Field of the invention

The present invention relates to a method for the preparation of a polypeptide of interest in authentic form by enzymatic cleavage of recombinantly produced fusion proteins by the use of Granzyme B protease. Furthermore, the invention pertains to fusion proteins comprising a Granzyme B cleavage site and to a human Granzyme B variant.

## Background of the invention and prior art

The production and purification of recombinant polypeptides such as pharmaceutical proteins in a highly purified and well-characterized form, has become a major task within the area of protein engineering in general, and in the pharmaceutical industry in particular.

The preparation of such recombinant polypeptides relies frequently on techniques which involve the production of the polypeptides as fusion proteins or hybrid proteins, wherein a protein or polypeptide of interest is fused to a carrier or a fusion partner such as a polypeptide or a protein.

The presence of a fusion partner or carrier which is fused to the polypeptide of interest has the advantages that it may render the fusion protein more resistant to proteolytic degradation, may facilitate enhanced expression and secretion, improve solubility and allow for subsequent affinity purification of the fusion protein. Also by fusion protein expression, potentially bio-hazardous materials, such as peptide hormones, may be produced in an inactive form which can then be activated subsequently *in vitro* by cleaving off the fusion partner.

However, such fusion proteins themselves are not normally suitable as end products as the fusion partner e.g. may affect the biological activity or stability of the polypeptide

of interest and, if the protein is to be used clinically, may cause antigenicity problems. Therefore it is necessary to cleave the fusion protein to release the polypeptide of interest.

In principle this can be achieved by chemical or biochemical methods such as enzymatic cleavage. However, it is important that the cleavage is highly specific and only takes place in a cleavage sequence between the polypeptide of interest and the fusion partner, i.e. the junction region, but preferably not within the polypeptide of interest itself, as this may e.g. severely affect the bioactivity of the polypeptide of interest. Such methods employ agents that act by hydrolysis of peptide bonds and the specificity of the cleavage agent is determined by the identity of the amino acid residue at or near the peptide bond which is cleaved.

Biochemical methods for cleavage of fusion proteins are based on the use of proteases (proteolytic enzymes). However, enzymatic cleavage of fusion proteins is limited in that the amino acid(s) which are specific for the cleavage site can at the same time also occur in the polypeptide of interest itself. Therefore, enzymes are particularly suitable which, in order to cleave, not only recognises one amino acid but rather a sequence of amino acids, since the probability that a particular amino acid sequence is present once again in the polypeptide of interest in addition to the cleavage site between the polypeptide of interest and the fusion partner is less the larger the number of amino acids necessary for the recognition and cleavage of the cleavage sequence.

Up till now, a number of proteases have been used for enzymatic cleavage of fusion proteins by contacting the fusion protein with a protease under appropriate conditions.

WO 03/010204 relates to a process for separating a polypeptide of interest from a fusion protein by the use of ubiquitin cleavage enzyme, which according to this document is an enzyme that cleaves a peptide bond next to the amino acid sequence RGG at the C-terminus of proteins such as ubiquitin.

US 6,010,883 disclose a method wherein blood clotting factor Xa (EC 3.4.21.6; a S1 serine-type peptidase formed from the proenzyme factor X by limited proteolysis) is used for cleaving off a fusion partner from a fusion protein. This protease specifically cleaves after the amino acid sequence X-Y-Gly-Arg, wherein X is Ile, Leu, Pro or Ala, and Y is Glu, Asp, Gln or Asn. Factor Xa preferably cuts after the cleavage sequence Ile-Glu-Gly-Arg.

Other prior art enzymes which have been suggested and used in methods for specific cleavage of fusion proteins include tobacco etch virus NIa proteinase, collagenase, enterokinase, subtilisin and thrombin.

However, several problems may be encountered when using proteolytic cleavage in fusion protein systems. One major problem is the occurrence of non-specific proteolytic attack of the fusion protein which results in cleavage at several locations and consequently product loss and generation of contaminating fragments. Also problems with inefficient or incomplete cleavage of the fusion protein frequently occur with the presently known enzymes. Such inefficient cleavage reduces the yield and may also introduce heterogeneity to the purified protein resulting in the recovery of only a small fraction of the desired protein.

A further problem that is associated with several of the presently applied enzymes for fusion protein cleavage is that spurious or extraneous amino acids are frequently attached to the cleaved polypeptide product (the polypeptide of interest). These amino acids are typically present when a linker is cleaved, and the unrelated amino acid residues may have an effect on the properties of the resulting polypeptide of interest. This may be critical for proteins produced for human therapeutics. Therefore, it is highly desirable to be able to produce pure authentic polypeptides free of extraneous amino acid short sequences or residues.

The problem with extraneous amino acids remaining on the polypeptide of interest after cleavage is illustrated in US 4,543,329 which describes a process for selectively cleaving a fusion protein by the use of collagenase. However, the use of this enzyme produces a polypeptide of interest with the extraneous amino acid sequence Gly-Pro at

its N-terminal. In order to obtain the polypeptide of interest in authentic form, these extraneous amino acids (Gly and Pro) must subsequently be removed in a further reaction step by the use of one or more different amino peptidases (such as aminoacylproline amino peptidase and proline amino peptidase).

The problem is also illustrated in US 5,427,927 which describes a process for sequence specific cleavage of fusion proteins by the use of IgA protease, wherein a IgA protease recognition site is inserted in the junction region of a fusion protein which is subsequently cleaved with IgA protease. The recognition site for the IgA protease is the amino acid sequence Y-Pro↓X-Pro, in which X can be any amino acid, Y can be one or several arbitrary amino acids, and ↓ denotes the cleavage site. However, the proteins of interest which are formed after cleavage by IgA protease, are characterised by having an X-Pro extraneous amino sequence at its N-terminal, i.e. the resulting polypeptide of interest is not in its native or authentic form.

Presently, the most widely used proteolytic enzymes for fusion protein cleavage are the serine proteases factor Xa and thrombin. However, both enzymes are known to perform non-specific cleavage of fusion proteins. In addition, factor Xa has to be isolated from bovine serum and as a consequence when it is used to cleave proteins for therapeutic applications an extensive purification and analysis is necessary afterwards in order to detect pathogenic factors such as viruses and prions which may be present (e.g. prions causing bovine spongiform encephalopathy). Furthermore, these enzymes are rather expensive.

In view of these prior art shortcomings and drawbacks, it is therefore an object of the present invention to provide an improved method for enzymatic cleavage of fusion proteins.

It has been found by the present inventors, that the above technical problems may be overcome by using Granzyme B protease (EC 3.4.21.79) for enzymatic cleavage of fusion proteins. Thus, it has surprisingly been found that Granzyme B protease allows for highly efficient cleavage of fusion proteins having a Granzyme B protease cleavage site with a high degree of cleavage specificity. In particular Granzyme B protease has

proven to perform more specific fusion protein cleavage than the presently and widely used protease factor Xa. It has furthermore been found that Granzyme B cleavage of fusion proteins that contain a Granzyme B recognition sequence positioned between an N-terminal fusion partner and a C-terminal polypeptide of interest, wherein the cleavage site is adjacent to the polypeptide of interest, results in a polypeptide of interest that have no extraneous amino acids derived from the cleavage site, i.e. a polypeptide in authentic form. Thus, recombinant proteins of interest with native amino acid sequence may be produced as a result of fusion protein cleavage by Granzyme B. Also, the Granzyme B protease has the advantage that it can be produced recombinantly. Finally, it has been found that by substituting the Cysteine amino acid no. 228 (chymotrypsinogen numbering) with Phenylalanine in human Granzyme B, a higher final protein recovery can be obtained when producing recombinant human Granzyme B.

## **Summary of the invention**

Accordingly, the present invention relates in a first aspect to a method for the preparation of a polypeptide of interest in authentic form. The method comprises the steps of: (i) providing a fusion protein comprising, from its N-terminal to its C-terminal (a) a fusion partner, (b) a Granzyme B protease recognition site comprising a Granzyme B protease cleavage site, (c) a polypeptide of interest, wherein said cleavage site being adjacent to the polypeptide of interest, and (ii) contacting the fusion protein with Granzyme B protease (EC 3.4.21.79) to cleave it at the cleavage site to yield the polypeptide of interest in authentic form.

In a further aspect there is provided a fusion protein comprising, from its N-terminal to its C-terminal, (a) a fusion partner, (b) a Granzyme B protease recognition site comprising a Granzyme B protease cleavage site, and (c) a polypeptide of interest, wherein said cleavage site being adjacent to the polypeptide of interest.

There is also provided a human Granzyme B protease variant wherein the Cystein residue no. 228 (chymotrypsinogen numbering) is mutated to Phenylalanine.

In still further aspects there is provided an isolated nucleic acid sequence encoding such a fusion protein or human Granzyme B protease variant, a recombinant vector comprising the isolated nucleic acid sequence, a host cell transformed with such a vector, and a method for the production of the fusion protein or the human Granzyme B protease variant which comprises the steps of (i) providing such a recombinant vector which is operatively linked to a promotor, (ii) transforming a host cell with the recombinant vector, (iii) culturing the host cell under conditions to express the fusion protein, and (iv) optionally isolating the fusion protein or the human Granzyme B protease variant.

## **Detailed disclosure of the invention**

In one aspect the present invention relates to a method for preparing a polypeptide of interest in authentic form by enzymatic cleavage of fusion proteins. Accordingly, the method comprises, as is mentioned above, a step of providing a fusion protein comprising from its N-terminal to its C-terminal, a fusion partner, a Granzyme B protease recognition site comprising a Granzyme B protease cleavage site and a polypeptide of interest, wherein the cleavage site is placed adjacent to the polypeptide of interest. The fusion protein is subsequently contacted with Granzyme B protease to cleave the fusion protein at the Granzyme B protease cleavage site to yield the polypeptide of interest in authentic form. The term "fusion protein" as used herein, refers to a polypeptide which comprises protein domains from at least two different proteins.

In accordance with the present invention there is provided a method for producing polypeptides of interest in authentic form. As used herein, the term "authentic form" refers to a polypeptide which comprises the amino acid sequence thereof without any additional amino acid residues. As described above, a major problem associated with several of the presently applied enzymes for fusion protein cleavage is that spurious or extraneous amino acids frequently remains attached to the cleaved polypeptide product, i.e. resulting in a polypeptide which is not in an "authentic form". Thus, in the present context the polypeptide of interest in authentic form refers to a polypeptide having the same primary amino acid sequence as that encoded by the native gene

sequence coding for the polypeptide of interest, i.e. it does not contain any non-native amino acids. The term "native gene sequence" is not necessarily a gene sequence that occurs in nature, but it may also be partly or completely artificial. Likewise it will be appreciated that a polypeptide of interest in authentic form not necessarily is a polypeptide that occurs in nature, but it may also be partially or completely artificial. In contrast, a "non-authentic" polypeptide contains at least one amino acid which is not encoded for by the native gene sequence coding for the polypeptide of interest.

In accordance with the invention, the junction region between the polypeptide of interest and the fusion partner comprises a Granzyme B protease recognition site which has a Granzyme B protease cleavage site. Such a recognition site refers to a defined amino acid sequence that allows Granzyme B to recognize and to cleave the junction region between the fusion partner and the polypeptide of interest. The cleavage site is thus to be understood as the site between two amino acids of an amino acid sequence at which the cleavage of the fusion protein takes place. The junction region may be in the form of a linker sequence of any suitable length which is not part of the polypeptide of interest. However, in order to obtain the polypeptide of interest in authentic form, the Granzyme B cleavage site is positioned adjacent to the N-terminus of the polypeptide of interest in order to allow for specific cleavage of the fusion protein at its N-terminus without resulting in spurious or extraneous amino acids remaining attached to the resulting polypeptide of interest. Hence, the term "adjacent to" imply that the Granzyme B recognition sequence, which in some embodiments may be preceded by or be a part of a linker sequence, is positioned such that the Granzyme B cleavage site is flanking the N-terminus of the polypeptide of interest.

Granzymes are granule-stored serine proteases that are implicated in T cell and natural killer cell-mediated cytotoxic defence reactions after target cell recognition. The principal function of granzymes is to induce the death of virus-infected and other potentially harmful cells. Granzyme B is one type of granzymes, and upon target cell contact it is directionally exocytosed and enters target cells assisted by perforin (a cytolytic protein expressed by cytotoxic T cells and natural killer cells). Granzyme B processes and activates various pro-caspases, thereby inducing apoptosis in the target cell. In accordance with the invention, the term "Granzyme B protease" (also

referred to herein as GrB) includes enzymes which are or may be classified under the Enzyme Commission number EC 3.4.21.79 in Enzyme nomenclature database, Release 34, February 2004 (<http://www.expasy.org/enzyme>). Thus, in accordance with the invention any suitable Granzyme B protease may be used including human Granzyme B protease, mouse Granzyme B protease and rat Granzyme B protease. It is generally preferred to use human Granzyme B, when the method in accordance with invention is used for the preparation of human therapeutic protein products. Human Granzyme B protease occurs in most human tissues where its biological function is well known. Therefore, the presence of trace amounts of residual Granzyme B protease in the final therapeutic protein product exhibit a minimal risk for the patient to whom the therapeutic protein product is administered. Thus, it is known that if active Granzyme B protease is injected into the human blood stream it is swiftly trapped by alpha-2-macroglobulin and the complex is cleared via the LRP scavenging receptor. Granzyme B protease is also known under the alternative name "Cytotoxic t-lymphocyte proteinase 2".

Granzyme B protease is known to have a preference for cleaving after aspartate residues (D), and Granzyme B is the only mammalian serine protease known to have this P1-proteolytic specificity. Hence, in accordance with the invention it is contemplated that the Granzyme B cleavage site in useful embodiments at least comprises an aspartate residue at the P1 position located N-terminally to the cleavage site. Some of the presently known Granzyme B protease recognition sites are disclosed in Harris et al (1998). Thus, in useful embodiments, the recognition site has an amino acid sequence of the general formula: P4 P3 P2 P1↓ located N-terminally to the cleavage site, wherein P4 preferably is amino acid I or V, P3 preferably is amino acid E, Q or M, P2 is X, where X denotes any amino acid, P1 preferably is amino acid D, and ↓ is the cleavage site for the Granzyme B protease.

It was found by the present inventors, that Granzyme B protease is capable of cleaving off polypeptides of interest from a fusion protein, without leaving any non-native amino acids on the polypeptide of interest. In particular it was surprisingly found that Granzyme B would recognise and cleave off polypeptides from a fusion protein after the P1 position without any strict requirements for specific amino acid residues at the

P1'-P4' positions, i.e. the amino acid positions following the cleavage site. This is contrary to the findings in the prior art. In e.g. Sun et al. (2001) it is concluded that the P1'-P4' residues of Granzyme B substrates are important for substrate binding, and that highest affinity for the substrate is observed when an acidic P4' residue is present (i.e. either aspartate or glutamic acid). Furthermore, Harris et al. (1998) concluded that Granzyme B has a strong preference for glycine residue at the P2' position. Despite these prior art findings, it has now been established that Granzyme B protease may be generally used for cleaving off polypeptides of interest from fusion proteins, without the need for specific amino acid residues at the P1'-P4' positions.

As mentioned above, a further particular advantage of the present invention is the finding that Granzyme B protease allows for highly efficient cleavage of fusion proteins having a Granzyme B protease cleavage site positioned N-terminally to the polypeptide of interest with a high degree of cleavage specificity. In particular it has been found that Granzyme B protease perform more specific fusion protein cleavage than the presently and widely used protease for fusion protein cleavage, namely factor Xa. Thus, as will be apparent from the below examples, it was found that when five different fusion proteins previously made as factor Xa cleavable fusion proteins, were cleaved by Granzyme B protease, it resulted in a cleavage performance that was as specific as or even more specific than that found with factor Xa. This may e.g. be seen from Example 8 and the accompanying Figure 11 illustrating an extended time course PAGE analysis of the digestion of the fusion proteins H6-IEGR-RAP and H6-IEPD-RAP with factor Xa and Granzyme B, respectively. It is clearly seen from this experiment that after 30 min. there was an essentially complete cleavage of the fusion proteins with both proteases. However, more breakdown products were produced by the use of factor Xa as compared to Granzyme B. This clearly shows that Granzyme B is highly specific, and even more specific than the widely used protease factor Xa. The high versatility and great flexibility of Granzyme B is further substantiated herein by the findings that Granzyme B is both capable of cleaving off relatively short N-terminal tags such as a hexa-His tail from a polypeptide of interest, and to cleave between a fusion partner and a polypeptide of interest which are very closely connected by a short linker sequence.

Although not necessary, it may in certain embodiments be advantageous to select the polypeptide of interest such that the polypeptide of interest, when it is a part of the fusion protein, N-terminally comprises the amino acids P1' and P2' resulting in the general Granzyme B recognition site formula  $P4\ P3\ P2\ P1\downarrow P1'\ P2'$  wherein P1' is X, where X denotes any amino, and P2' is G. Although Granzyme B protease has no strict amino acid selectivity for the P1' position, there is a general preference for large hydrophobic amino acids at this position including Trp (T), Leu (L), Phe (F) and Ile (I). Thus, in one useful embodiment the amino acid at position P1' is selected from T, L, F and I. It may in certain embodiments be advantageous not to include Pro (P) at the P2' position. It may in a further aspect of the invention be advantageous that the polypeptide of interest is selected such that it, when being part of the fusion protein, N-terminally comprises an acidic amino acid at the P4' position, such as D or E.

In the present context the terms "amino acid" and "amino acid residues" refer to all naturally occurring L-alpha-amino acids. This definition is meant to include norleucine, ornithine, and homocysteine. The amino acids are identified by either the three-letter or single-letter designations:

Asp, D: aspartic acid	Ile, I: isoleucine
Thr, T: threonine	Leu, L: leucine
Ser, S: serine	Tyr, Y: tyrosine
Glu, E: glutamic acid	Phe, F: phenylalanine
Pro, P: proline	His, H: histidine
Gly, G: glycine	Lys, K: lysine
Ala, A: alanine	Arg, R: arginine
Cys, C: cysteine	Trp, W: tryptophan
Val, V: valine	Gln, Q: glutamine
Met, M: methionine	Asn, N: asparagine
Nle, J: norleucine	Orn, O: ornithine
Hcy, U: homocysteine	Xxx, X: any L-alpha-amino acid.

In further useful embodiments, the Granzyme B protease recognition site has an amino acid sequence which is selected from ICPD↓, IEAD↓, IEPD↓, IETD↓, IQAD↓, ISAD↓, ISSD↓, ITPD↓, VAPD↓, VATD↓, VCTD↓, VDPD↓, VDSD↓, VEKD↓, VEQD↓, VGPD↓,

VEID↓, VRPD↓, VTPD↓, LEED↓, LEID↓, LGND↓, LGPD↓, AQP↓, where ↓ is the cleavage site for Granzyme B. These recognition and cleavage sites have previously been described by Casciola-Rosen et al. (1999).

In accordance with the invention the terms "polypeptide of interest" or "desired polypeptide" refer to the polypeptide whose expression is desired within the fusion protein. As used herein, the term "polypeptide" should not necessarily indicate a limit on the size of the desired polypeptide of interest. Thus, this term is to be interpreted in its broadest sense, and hence includes peptides on the order of up to 50 or more amino acids, including oligopeptides such as di-, tri, tetra-, penta-, and hexa-peptides, polypeptides and proteins. The polypeptide of interest may be an intermediate product or a final product which can for example be used in the field of medicine, in research, in environmental protection, or in industrial processes or products. As previously described, in the fusion protein the polypeptide of interest is joined or fused with another protein or protein domain, the fusion partner, to allow for e.g. enhanced stability of the polypeptide of interest and ease of purification of the fusion protein. In useful embodiments the polypeptide of interest is a protein such as a secreted protein. Secreted proteins have various industrial applications, including as pharmaceuticals, and diagnostics. Most protein drugs available at present, such as thrombolytic agents, interferons, interleukins, erythropoietins, colony stimulating factors, and various other cytokines, are secreted proteins. In useful embodiments the polypeptide of interest is a polypeptide hormone such as somatotrophin, glucagon, insulin or interferon, a single chain antibody variable region fragment (scfv), or an apolipoprotein such as apolipoprotein a-i (apoA-I), apolipoprotein A-II, or apolipoprotein A-IV.

In a further aspect of the invention the polypeptide of interest is an enzyme, such as Granzyme B. Thus, by providing a fusion protein in accordance with the invention and selecting Granzyme B protease as the polypeptide of interest, there is provided a self-activating Granzyme B protease which offers the possibility of providing inactive pro-Granzyme B which subsequently may be activated, in principle, by the addition of a single molecule of active Granzyme B protease. Thereby, there is provided pro-Granzyme B which is not dependent on the addition of e.g. external activator biologicals for its activation. As will be apparent from the following examples, the

Granzyme B self activation was found to progress quantitatively to completion, and self activating samples of Granzyme B protease subjected to further incubation for several days were found to retain stable activity levels and produce minimal amounts of autolysis products. This clearly demonstrates that self-activating Granzyme B protease has the advantage of being highly stable to autolysis (cannibalism), as shown in Example 5 and Figure 3.

The fusion partner may, in accordance with the invention, be of any suitable kind provided that it is a peptide, oligopeptide, polypeptide or protein, including a tetra-peptide, penta-peptide and a hexa-peptide. It may be selected such that it renders the fusion protein more resistant to proteolytic degradation, facilitate enhanced expression and secretion of the fusion protein, improve solubility, and allow for subsequent affinity purification of the fusion protein.

The fusion protein of the present invention may in useful embodiments comprise a fusion partner which is an affinity-tag. Such an affinity-tag may e.g. be an affinity domain which permits the purification of the fusion protein on an affinity resin. The affinity-tag may also be a polyhistidine-tag including hexahis-tag, a polyarginine-tag, a FLAG-tag, a Strep-tag, a c-myc-tag, a S-tag, a calmodulin-binding peptide, a cellulose-binding peptide, a chitin-binding domain, a glutathione S-transferase-tag, or a maltose binding protein.

As mentioned above, any suitable Granzyme B protease may be used in accordance with the invention including human Granzyme B protease, mouse Granzyme B protease and rat Granzyme B protease. However, as will be apparent from the following Examples, it was found that by substituting the Cystein residue no. 228 (chymotrypsinogen numbering) with Phenylalanine in human Granzyme B protease, there is provided a human Granzyme B protease variant which results in a higher final protein yield when producing human Granzyme B, even without affecting the cleavage specificity or activity of the resulting Granzyme B to any noticeable degree. This finding is contrary to what would have been expected, as the amino acid Phenylalanine (aromatic amino acid) is chemically very different from Cysteine (hydrophilic amino acid) and would therefore not normally be the choice for a Cysteine substitution. Thus,

in a presently preferred embodiment the Granzyme B protease according to the invention is a human Granzyme B protease variant wherein the Cystein residue no. 228 (chymotrypsinogen numbering) is mutated to Phenylalanine. It will be appreciated that the term "human Granzyme B protease variant" also includes variants which in addition to the Cystein residue no. 228 (chymotrypsinogen numbering) mutation, have further variations in the full-length sequence of native human Granzyme B protease or in various domains, e.g. Granzyme B protease variants wherein one or more amino acid residues are added, or deleted, at the N- or C-terminus of the full-length native Granzyme B amino acid sequence. Such further variations can be made, for example, using any of the techniques and guidelines for conservative and non-conservative mutations known in the art. Variations may be a substitution, deletion or insertion of one or more codons encoding the human Granzyme B protease that results in a change in the amino acid sequence of the human Granzyme B protease as compared with the native sequence of human Granzyme B protease preferably without adversely affecting the human Granzyme B protease specificity and/or activity. Also fragments of the full-length native Granzyme B amino acid sequence, such as the activated form, having a Cystein residue no. 228 mutation is included in the meaning of "human Granzyme B protease variant". In a useful embodiment the Granzyme B protease variant is the variant shown in SEQ ID NO 57.

In general the fusion partner will typically be selected on the basis of characteristics contributing to ease isolation, most desirable being those that are readily secreted by the microorganisms producing the fusion protein. Polyhistidine sequences, glutathione S-transferase and maltose binding protein, for example, are generally preferred as there are readily available affinity columns to which they can be bound and eluted from.

The method according to the invention may in useful embodiments include a subsequent isolation step for isolating the polypeptide of interest which is formed by the enzymatic cleavage of the fusion protein. This isolation step can be performed by any suitable means known in the art for protein isolation, including the use of ion exchange, fractionation by size and affinity purification, the choice of which depending on the character of the polypeptide of interest. Thus the polypeptide of interest may for

the purpose of affinity purification e.g. further comprise a C-terminally linked affinity-tag in to order to provide for isolation of the resulting polypeptide of interest using e.g. the above mentioned affinity-tag systems.

In accordance with the invention the fusion protein is contacted with Granzyme B protease to cleave the fusion protein at the Granzyme B protease cleavage site adjacent to the polypeptide of interest to yield the polypeptide of interest in authentic form. This reaction may be carried out batchwise using free Granzyme B, or it may be carried out by using Granzyme B protease in an immobilised form, e.g. via adsorption, covalent binding, entrapment or membrane confinement. Suitable carriers for immobilised Granzyme B protease include conventional carriers such as polyacrylamide, chitin, dextran, kappa carrageenan, celite and cellulose. Immobilisation of enzymes by their covalent coupling to insoluble matrices is an extensively used technique. Lysine residues are found to be the most generally useful groups for covalent bonding of enzymes to insoluble supports due to their widespread surface exposure and high reactivity. Thus, in useful embodiments the Granzyme B protease is immobilised via a lysine amino acid residue. In a further aspect the Granzyme B protease is immobilised via its C-terminus, e.g. by means of a polyhistidine-tag, including a hexa-histidine-tag. The reaction may also be conducted by using a free Granzyme B protease in combination with a membrane-type bioreactor, or using a continuous type bioreactor together with an immobilised Granzyme B protease.

As will be apparent from the following examples, it has surprisingly been found that the time required for the cleavage of free fusion proteins (i.e. not immobilised) which comprises a polyhistidine fusion partner such as hexa-histidine, may be decreased dramatically if the fusion protein is contacted with Granzyme B protease in the presence of  $\text{Ni}^{2+}$  ions and Nitrilotriacetic Acid (NTA). It is contemplated that the main reason for this remarkable increase in cleavage speed, is that the  $\text{Ni}^{2+}$  ions bind the N-terminal polyhistidine fusion partner of the fusion protein and facilitate access for the Granzyme B protease to the cleavage site. Additionally it is also considered that the addition of NTA will shield the  $\text{Ni}^{2+}$  ions in solution in a similar fashion as on a  $\text{Ni}^{2+}$ -NTA agarose column, and thereby avoid precipitation of both the fusion protein and the

resulting protein. When performing such a cleavage process, it is generally preferred that the concentration of  $\text{Ni}^{2+}$  is in the range of 1-20 mM, and the concentration of NTA is in the range of 1-20 mM. Furthermore, the temperature is preferably in the range of 15-50°C, including the range of 20-45°C. In a preferred embodiment, the temperature is in the range of 20-30°C, such as about 23°C. In another slightly less preferred embodiment, the temperature is in the range of 30-45°C, such as about 37°C. The optimal temperature range, though, must be determined for each fusion protein, since it depends in part on the stability of the fusion protein at the different temperatures.

In accordance with the invention there is as already described above, also provided a fusion protein comprising, from its N-terminal to its C-terminal, (a) a fusion partner, (b) a Granzyme B protease recognition site comprising a Granzyme B protease cleavage site, and (c) a polypeptide of interest, wherein the cleavage site being adjacent to the polypeptide of interest. In useful embodiments, the polypeptide of interest is Granzyme B, which thereby provides for a self-activating Granzyme B protease. In particular there is provided self-activating human pro-Granzyme B fusion proteins comprising from the N-terminal to the C-terminal, a seven amino acid residue pro-sequence having a Granzyme B recognition site and cleavage site followed by the amino acid sequence for activated human Granzyme B, and finally a hexa-Histidine tag (H6) fused to the C-terminal of the Granzyme B. Thus, the Granzyme B cleavage site is located adjacent to the Ile16 (chymotrypsinogen numbering) of the amino acid sequence for activated Granzyme B. More particular there is provided the human self-activating Granzyme B fusion proteins pro-IEPD-GrB-H6 (SEQ ID NO 2) and pro-IEAD-GrB-H6 (SEQ ID NO 3). As also previously described, it was found to be advantageous, to substitute the Cystein residue no. 228 (chymotrypsinogen numbering) with alanine (A), threonine (T), valine (V), or phenylalanine (F) by site-directed mutation. Thus, in further useful embodiments there is provided self-activating fusion proteins selected from the group consisting of pro-IEPD-GrB-H6 C228A (SEQ ID NO 5), pro-IEPD-GrB-H6 C228T (SEQ ID NO 6), pro-IEPD-GrB-H6 C228V (SEQ ID NO 7), and pro-IEPD-GrB-H6 C228F (SEQ ID NO 8).

The fusion protein or the Granzyme B protease variant of the present invention may be expressed in any suitable standard protein expression system by culturing a host

transformed with a vector encoding the fusion protein under such conditions that the fusion protein is expressed. Preferably, the expression system is a system from which the desired fusion protein may readily be isolated and refolded *in vitro*. As a general matter, prokaryotic expression systems are preferred since high yields of protein can be obtained and efficient purification and refolding strategies are available. However, numerous host cells may be selected as appropriate for transformation and expression of the described fusion protein, including mammalian insect, fungal and bacterial host cells which are particularly desirable. Commonly used bacterial strains include *Bacillus* and *Escherichia*, including *E. coli*. Thus, it is well within the abilities and discretion of the skilled artisan, without undue experimentation, to choose an appropriate or favourite host and expression system. Similarly, once the primary amino acid sequence for the fusion protein of the present invention is chosen, one of ordinary skill in the art can easily design appropriate recombinant nucleic acid sequence or DNA constructs encoding the fusion proteins or the Granzyme B protease variant of the invention, taking into consideration such factors as codon biases in the chosen host, the need for secretion signal sequences in the host, the introduction of proteinase cleavage sites within the signal sequence, and the like. These recombinant DNA constructs may be inserted in-frame into any of a number of expression vectors appropriate to the chosen host. The choice of an appropriate or favourite expression vector is, again, a matter well within the ability and discretion of the skilled practitioner. Preferably, the expression vector will include a strong promoter to drive expression of the recombinant constructs.

Finally, there is provided a method for the production of a fusion protein or the Granzyme B protease variant according to invention which comprises the steps of (i) providing a recombinant vector comprising the isolated nucleic acid sequence encoding the fusion protein or the Granzyme B protease variant of the invention which is operatively linked to a promoter, (ii) transforming a host cell with this recombinant vector, (iii) culturing the host cell under conditions to express the fusion protein, and (iv) optionally isolating the fusion protein or the Granzyme B protease variant.

The invention will now be described by way of illustration in the following non-limiting examples and figures.

## Description of the figures

Figure 1 shows the activity of an incubation of GrB-H6 with FX<sub>a</sub> followed for several days using the following colorimetric assay: 500  $\mu$ l buffer (100 mM NaCl, 50 mM Tris-HCl pH 8.0), 4  $\mu$ l 100 mM Ac-IEPD-pNA and 5  $\mu$ l GrB-H6. A mixture of 100  $\mu$ l GrB-H6 (approximately 10  $\mu$ g) with 1  $\mu$ l FX<sub>a</sub> (1 mg/ml) was kept at 4°C during the incubation, and the activity was measured after 0 hours, 2 hours, 5 hours, 19 hours, 2 days and 5 days.

Figure 2 shows the activity of both GrB-H6 and GrB-H6 C228F towards several chromogenic substrates: Ac-IEPD-pNA, Ac-LEED-pNA, Ac-VEID-pNA, Ac-YVAD-pNA, and Ac-DEVD-pNA. The activity assay was carried out in 500  $\mu$ l 100 mM HEPES pH 7.75 with a substrate concentration of 400  $\mu$ M and 1  $\mu$ g protease added for each measurement. All measurements were done at 23°C and in triplicate, and the activities obtained were normalized by setting the activity measured on Ac-IEPD-pNA to 100 %.

Figure 3, panel (A) shows the SDS PAGE of samples from the incubation of GrB-H6 C228F in 100 mM HEPES pH 7.4 at 4°C, 23°C, and 37°C.

Description of lanes A-N:

- A: Molecular weight marker
- B: GrB-H6 C228F, before incubation
- C: GrB-H6 C228F incubated at 4°C for 1 day
- D: GrB-H6 C228F incubated at 4°C for 3 days
- E: GrB-H6 C228F incubated at 4°C for 6 days
- F: GrB-H6 C228F incubated at 4°C for 15 days
- G: GrB-H6 C228F incubated at 23°C for 1 day
- H: GrB-H6 C228F incubated at 23°C for 3 days
- I: GrB-H6 C228F incubated at 23°C for 6 days
- J: GrB-H6 C228F incubated at 23°C for 15 days
- K: GrB-H6 C228F incubated at 37°C for 1 day
- L: GrB-H6 C228F incubated at 37°C for 3 days
- M: GrB-H6 C228F incubated at 37°C for 6 days

N: GrB-H6 C228F incubated at 37°C for 15 days

Lane B shows the intact GrB-H6 C228F. This band of intact protease can be seen in all lanes (1). In lanes I-N another band appears (2), which must be a degradation product of the protease, possibly arisen by auto cleavage between Asp50 and Phe51 in the sequence IQDD↓FV.

Figure 3, Panel (B) shows the activity of the samples of GrB-H6 C228F incubated in 100 mM HEPES pH 7.4 at 4°C, 23°C, and 37°C measured after 0, 6, (10), and 15 days. The activity was measured in 500 µl 100 mM HEPES pH 7.4 and 400 µM Ac-IEPD-pNA with 0.2 µg GrB-H6 C228F from the incubations added for each measurement.

Figure 4 shows the SDS PAGE of samples from the H6-TripUB IEPD↓SP and H6-IEPD-TN123 incubations after 12 hours incubation with GrB-H6.

Description of the lanes A-J:

A: Molecular weight marker

B: H6-TripUB IEPD↓SP alone after 12 hours incubation

C: 200 µl H6-TripUB IEPD↓SP + 1 µl GrB-H6 after 12 hours incubation

D: 200 µl H6-TripUB IEPD↓SP + 10 µl GrB-H6 after 12 hours incubation

E: H6-FX-TripUB incubated with FX<sub>a</sub>

F: H6-IEPD-TN123 alone after 12 hours incubation

G: 200 µl H6-IEPD-TN123 + 1 µl GrB-H6 after 12 hours incubation

H: 200 µl H6-IEPD-TN123 + 10 µl GrB-H6 after 12 hours incubation

I: GrB-H6 alone in the same concentration as in lanes D and H

J: Murine H6-FX-TN123 cleaved with FX<sub>a</sub>

Lane B shows non-cleaved H6-TripUB IEPD↓SP (1), where no GrB-H6 was added, while lanes C and D show the two incubations with 1 and 10 µl GrB-H6 added. In both these lanes the product of the cleavage reaction; correctly cleaved H6-TripUB IEPD↓SP (2) is seen in addition to the non-cleaved fusion protein. In lane E the construct H6-FX-TripUB, containing the FX<sub>a</sub> recognition site IQGR in place of the GrB recognition site IEPD, is cleaved by FX<sub>a</sub> giving a product of the same size as the GrB-H6 cleaved H6-TripUB IEPD↓SP.

Lanes F-J show the GrB-H6 + H6-IEPD-TN123 incubations after 12 hours. In lane F is shown non-cleaved H6-IEPD-TN123 (3). Lanes G and H show how H6-IEPD-TN123 is cleaved by GrB-H6 when no  $\text{Ca}^{2+}$  is present (4). The band pattern is explained in figure 12. In lane J the murine H6-FX-TN123 construct has been cleaved by  $\text{FX}_a$  showing the size of the correctly cleaved product.

Marked by (5) in the figure is the position of GrB-H6 with the same concentration as in the samples with 10  $\mu\text{l}$  GrB-H6 added.

Figure 5 shows the SDS PAGE of the samples from the GrB-H6 + H6-TripUB IEPD $\downarrow$ SP incubations after 12, 19 and 24 hours of incubation, as well as the samples from the GrB-H6 + H6-IEPD-TN123 incubations.

Description of the lanes A-K:

A: Molecular weight marker

B: H6-TripUB IEPD $\downarrow$ SP alone after 12 hours incubation

C: 200  $\mu\text{l}$  H6-TripUB IEPD $\downarrow$ SP + 1  $\mu\text{l}$  GrB-H6 after 12 hours incubation

D: 200  $\mu\text{l}$  H6-TripUB IEPD $\downarrow$ SP + 1  $\mu\text{l}$  GrB-H6 after 19 hours incubation

E: 200  $\mu\text{l}$  H6-TripUB IEPD $\downarrow$ SP + 1  $\mu\text{l}$  GrB-H6 after 24 hours incubation

F: 200  $\mu\text{l}$  H6-TripUB IEPD $\downarrow$ SP + 10  $\mu\text{l}$  GrB-H6 after 19 hours incubation

G: 200  $\mu\text{l}$  H6-TripUB IEPD $\downarrow$ SP + 10  $\mu\text{l}$  GrB-H6 after 24 hours incubation

H: GrB-H6 alone diluted as in F and G

I: H6-IEPD-TN123 alone after 12 hours incubation

J: 200  $\mu\text{l}$  H6-IEPD-TN123 + 1  $\mu\text{l}$  GrB-H6 after 12 hours incubation

K: 200  $\mu\text{l}$  H6-IEPD-TN123 + 10  $\mu\text{l}$  GrB-H6 after 12 hours incubation

Lane B shows non-cleaved H6-TripUB IEPD $\downarrow$ SP (1). In lanes C-E the correctly cleaved product appears in all lanes, marked by (2) in the figure. The more GrB-H6 added and the longer the incubation time, the more cleavage product appears in the lanes.

Lanes I, J, and K in Figure 3 are identical to lanes F, G, and H in figure 2 with the H6-IEPD-TN123 + GrB-H6 incubations, though a larger sample has been run on the gel in Figure 3. The bands are therefore much clearer than in figure 2. The band marked with (3) is non-cleaved H6-IEPD-TN123 and the band pattern marked with (4), (5), (6) and (7) is explained in figure 12.

Figure 6 explains the simple band pattern observed in figures 2 and 3. When no GrB-H6 is added, no cleavage occurs and only the band from the non-cleaved fusion protein is seen in the gel. When GrB-H6 is added, the small N-terminal sequence is cleaved off and the correctly cleaved product appears on the gel in addition to the remaining non-cleaved fusion protein. The small N-terminal sequence cleaved off by GrB-H6 is too small to be visualized on the SDS gel.

Figures 7, 8 and 9 show the SDS PAGE of the samples from the H6-TripUB IEPD↓SP + GrB-H6 incubations at 23°C (figure 5), 37°C (figure 6) and 42°C (figure 7) with no addition (1), addition of 4.2 mM Ni<sup>2+</sup> (2) and addition of 4.2 mM Ni<sup>2+</sup> + 5 mM NTA (3). Description of the lanes A-K (same for all temperatures):

A: Molecular weight marker

B: Non-cleaved H6-TripUB IEPD↓SP

C: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, no addition

D: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, no addition

E: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, no addition

F: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, 4.2 mM Ni<sup>2+</sup>

G: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, 4.2 mM Ni<sup>2+</sup>

H: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, 4.2 mM Ni<sup>2+</sup>

I: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, 4.2 mM Ni<sup>2+</sup> and 5 mM NTA

J: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, 4.2 mM Ni<sup>2+</sup> and 5 mM NTA

K: 200 µl H6-TripUB IEPD↓SP + 5 µl GrB-H6, 4.2 mM Ni<sup>2+</sup> and 5 mM NTA

In lanes C-E (1) in all three figures where no Ni<sup>2+</sup> or NTA was added, the H6-TripUB IEPD↓SP fusion protein is cleaved at different rates for different temperatures. After 22 hours at 23°C approximately 40% of the fusion protein has been cleaved. At 37°C and 42°C more was cleaved after 22 hours than at 23°C, approximately 60% at 37°C and 50% at 42°C.

Because of the precipitation of protein observed at 37°C and 42°C with 4.2 mM Ni<sup>2+</sup> no further cleavage of the fusion protein after 2 hours incubation was seen in the gel.

Therefore less protein was seen in lanes F-H (2) in figures 6 (37°C) and 7 (42°C) than in lanes F-H (2) in figure 5 (23°C). In figure 5, lanes F-H (2), approximately 50 % of the

fusion protein was cleaved to product after 22 hours incubation, which is more than was cleaved with no addition of  $\text{Ni}^{2+}$ .

No precipitation was observed with 4.2 mM  $\text{Ni}^{2+}$  + 5 mM NTA added to the incubations. In figure 5 lanes I-K (3) more product is seen than in lanes C-E (1) and F-H (2), so after 22 hours incubation at 23°C with both  $\text{Ni}^{2+}$  and NTA present approximately 60 % of the fusion protein has been cleaved compared to only about 40 % with no addition and 50 % with  $\text{Ni}^{2+}$  alone.

By further increasing the temperature to 37°C (figure 6 lanes I-K (3)) and 42°C (figure 7 lane I-K (3)) an even greater increase in the rate of cleavage is seen. After 22 hours of incubation at 37°C almost all the fusion protein is cleaved to the correct product. A little less is cleaved at 42°C after 22 hours.

Figure 10 shows the SDS PAGE of the samples from the H6-IEPD-RAP incubations with 1 or 10  $\mu\text{l}$  GrB-H6. Description of the lanes (A-L):

A: Molecular weight marker

B: H6-IEPD-RAP alone after 5 hours incubation

C: 200  $\mu\text{l}$  H6-IEPD-RAP + 1  $\mu\text{l}$  GrB-H6 after 5 hours incubation

D: 200  $\mu\text{l}$  H6-IEPD-RAP + 10  $\mu\text{l}$  GrB-H6 after 5 hours incubation

E: H6-IEPD-RAP alone after 23 hours incubation

F: 200  $\mu\text{l}$  H6-IEPD-RAP + 1  $\mu\text{l}$  GrB-H6 after 23 hours incubation

G: 200  $\mu\text{l}$  H6-IEPD-RAP + 10  $\mu\text{l}$  GrB-H6 after 23 hours incubation

H: H6-IEGR-RAP cut partly with  $\text{FX}_a$ , purified

I: H6-IEGR-RAP cut almost completely with  $\text{FX}_a$ , purified

J: H6-IEPD-RAP alone after 26 hours incubation

K: 200  $\mu\text{l}$  H6-IEPD-RAP + 1  $\mu\text{l}$  GrB-H6 after 26 hours incubation

L: 200  $\mu\text{l}$  H6-IEPD-RAP + 10  $\mu\text{l}$  GrB-H6 after 26 hours incubation

Non-cleaved H6-IEPD-RAP (1) is shown in lanes B, E, and J. In lanes C and D it is clear that all the H6-IEPD-RAP has been cleaved to give the final product (2) after only 5 hours incubation with either 1 or 10  $\mu\text{l}$  GrB-H6 as described above. It is also clear that there is at least one internal cleavage site in RAP giving rise to the two lower bands appearing in these lanes, i.e. the final product is cleaved into two pieces both visible on the gel (3). Lanes F and G and lanes K and L show essentially the same as

lanes C and D, though the samples were taken later, after 23 and 26 hours of incubation with GrB-H6 giving rise to more cleavage in the apparent internal site in RAP.

In lanes H and I is shown purified samples of H6-IEGR-RAP cleaved partly (lane H) or completely (lane I) by FX<sub>a</sub> to give the final RAP product. In these lanes the degradation products from any internal cleavage by FX<sub>a</sub> has been removed by purification.

Figure 11 shows the SDS PAGE of the samples from the H6-IEPD-RAP + GrB-H6 and the H6-IEGR-RAP + FX<sub>a</sub> incubations. Description of the lanes (A-O):

A: Molecular weight marker

B: H6-IEGR-RAP alone after 27 hours incubation

C: 400 µl H6-IEGR-RAP + 1 µl FX<sub>a</sub> after ½ hour incubation

D: 400 µl H6-IEGR-RAP + 1 µl FX<sub>a</sub> after 1 hour incubation

E: 400 µl H6-IEGR-RAP + 1 µl FX<sub>a</sub> after 3 hours incubation

F: 400 µl H6-IEGR-RAP + 1 µl FX<sub>a</sub> after 5 hours incubation

G: 400 µl H6-IEGR-RAP + 1 µl FX<sub>a</sub> after 7 hours incubation

H: 400 µl H6-IEGR-RAP + 1 µl FX<sub>a</sub> after 27 hours incubation

I: H6-IEPD-RAP alone after 27 hours incubation

J: 400 µl H6-IEPD-RAP + 2 µl GrB-H6 after ½ hour incubation

K: 400 µl H6-IEPD-RAP + 2 µl GrB-H6 after 1 hour incubation

L: 400 µl H6-IEPD-RAP + 2 µl GrB-H6 after 3 hours incubation

M: 400 µl H6-IEPD-RAP + 2 µl GrB-H6 after 5 hours incubation

N: 400 µl H6-IEPD-RAP + 2 µl GrB-H6 after 7 hours incubation

O: 400 µl H6-IEPD-RAP + 2 µl GrB-H6 after 27 hours incubation

In lanes B-H are the samples from the H6-IEGR-RAP incubation (1), where lane B shows non-cleaved H6-IEGR-RAP. Lane C-H shows that after only ½ hour almost all of the fusion protein has been cleaved by FX<sub>a</sub> to give the correct product. In lanes D-G some degradation products show up, and in lane H after 27 hours of incubation all of the fusion protein has been degraded to give a variety of smaller pieces, and there is no correctly cleaved product left.

Lanes I-O shows the samples from the H6-IEPD-RAP incubation (2). Lane I shows non-cleaved H6-IEPD-RAP, and as for H6-IEGR-RAP nearly all the H6-IEPD-RAP has

been cleaved correctly after only ½ hour incubation with GrB-H6, as is seen in lane J. In lanes K-N degradation products show up, but not nearly as many as for the H6-IEGR-RAP incubation. In lane O after 27 hours of incubation there is still quite a lot of correctly cleaved product left.

Figure 12 shows the SDS PAGE of the samples from the H6Ubi-IEPD-ApoA1 + GrB-H6 C228F and the H6Ubi-IEGR-ApoA1 + FX<sub>a</sub> incubations. Description of the lanes (A-M):

A: Molecular weight marker

B: H6Ubi-IEPD-ApoA1 alone, 0 hours incubation

C: 400 µg H6Ubi-IEPD-ApoA1 + 0.4 µg GrB-H6 C228F, 1 hour incubation

D: 400 µg H6Ubi-IEPD-ApoA1 + 0.4 µg GrB-H6 C228F, 3 hour incubation

E: 400 µg H6Ubi-IEPD-ApoA1 + 0.4 µg GrB-H6 C228F, 6 hours incubation

F: 400 µg H6Ubi-IEPD-ApoA1 + 0.4 µg GrB-H6 C228F, 24 hours incubation

G: 400 µg H6Ubi-IEPD-ApoA1 + 0.4 µg GrB-H6 C228F, 48 hours incubation

H: H6Ubi-IEGR-ApoA1 alone, 0 hours incubation

I: 350 µg H6Ubi-IEGR-ApoA1 + 0.35 µg FX<sub>a</sub>, 1 hour incubation

J: 350 µg H6Ubi-IEGR-ApoA1 + 0.35 µg FX<sub>a</sub>, 3 hour incubation

K: 350 µg H6Ubi-IEGR-ApoA1 + 0.35 µg FX<sub>a</sub>, 6 hours incubation

L: 350 µg H6Ubi-IEGR-ApoA1 + 0.35 µg FX<sub>a</sub>, 24 hours incubation

M: 350 µg H6Ubi-IEGR-ApoA1 + 0.35 µg FX<sub>a</sub>, 48 hours incubation

In lanes B-G are the samples from the H6Ubi-IEPD-ApoA1 incubation (1), where lane B shows the non-cleaved H6Ubi-IEPD-ApoA1 preparation. Lanes H-M shows the samples from the H6Ubi-IEGR-ApoA1 incubation (2), where lane H shows the non-cleaved H6Ubi-IEGR-ApoA1 preparation. The position of the intact, non-cleaved fusion proteins is indicated by (3). The bands marked by (4) is the correctly cleaved ApoA1 product, whereas the bands marked with (5) H6Ubi fusion partner.

Figure 13 shows the SDS PAGE of the samples from the H6-IEPD-TN123 + GrB-H6 incubation after 12 hours and 5 days without addition of Ca<sup>2+</sup>. Some samples have been reduced. Description of the lanes (A-N):

A: Molecular weight marker

B: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 after 5 days incubation,  
sample reduced

C: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 after 5 days incubation,  
sample reduced

D + E: H6-IEPD-TN123 alone after 5 days incubation

F: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 after 5 days incubation

G: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 after 5 days incubation

H: GrB-H6 alone diluted as in C and G

I: H6-IEPD-TN123 alone after 12 hours incubation

J: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 after 12 hours incubation

K: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 after 12 hours incubation

L: H6-IEPD-TN123 alone after 12 hours incubation, sample reduced

M: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 after 12 hours incubation,  
sample reduced

N: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 after 12 hours incubation,  
sample reduced

Lanes I-K are identical to lanes F-H in figure 2 and I-K in figure 3, i.e. samples after 12 hours incubation with either 0, 0.2 or 2  $\mu$ g GrB-H6. Here the band pattern (1) indicates an internal cleavage site in the TN123 part of H6-IEPD-TN123, and the pattern is further explained in figure 12. Lanes D-G show the incubations after 5 days, and here most of the fusion protein has been cleaved. In lane G (10  $\mu$ l GrB-H6 added) almost all of the fusion protein has been cleaved twice (2); at the IEPD↓ sequence as well as at the internal site in TN123 with the sequence AQP↓.

Lanes L-N and lanes B-D show the same samples after 12 hours and after 5 days, respectively, but here the samples are reduced. This band pattern (3) is also explained in Figure 12 and again almost all of the fusion protein has been cleaved twice after 5 days with 10  $\mu$ l GrB-H6, lane C (4).

Figure 14 shows the SDS PAGE of the samples from the H6-IEPD-TN123 + GrB-H6 incubation after 12 hours and 2 days with the addition of 5 mM  $\text{Ca}^{2+}$ . Some samples have been reduced. Description of the lanes (A-K):

A: Molecular weight marker

B: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 and 5 mM  $\text{CaCl}_2$ , sample reduced  
 C: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 and 5 mM  $\text{CaCl}_2$ , sample reduced  
 D: H6-IEPD-TN123 alone  
 E: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 and 5 mM  $\text{CaCl}_2$   
 F: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 and no  $\text{CaCl}_2$   
 G: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 and 5 mM  $\text{CaCl}_2$   
 H: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 and no  $\text{CaCl}_2$   
 I: GrB-H6 alone diluted as in G and H  
 J: 200  $\mu$ l H6-IEPD-TN123 + 1  $\mu$ l GrB-H6 and no  $\text{CaCl}_2$  after 2 days incubation  
 K: 200  $\mu$ l H6-IEPD-TN123 + 10  $\mu$ l GrB-H6 and no  $\text{CaCl}_2$  after 2 days incubation  
 Lanes B-H and J-K show the incubations of H6-IEPD-TN123 with GrB-H6 after 12 hours and 2 days, respectively.

Lane D shows non-cleaved H6-IEPD-TN123. Comparing lane E and G (+ 5 mM  $\text{Ca}^{2+}$ ) with lane F and H (no  $\text{Ca}^{2+}$ ) only two bands appear with 5 mM  $\text{Ca}^{2+}$  present (1), while four bands appear (2) when no  $\text{Ca}^{2+}$  is present, as described for Figures 2, 3, 10 and 12. After 12 hours incubation with 10  $\mu$ l GrB-H6 approximately 40 % of the fusion protein has been correctly cleaved when  $\text{Ca}^{2+}$  is present (lane G), while the cleavage of the two sites when no  $\text{Ca}^{2+}$  is present happens a bit faster (lane H after 12 hours and K after 2 days). In lane K almost all the fusion protein has been cleaved twice (3). The samples in lanes B and C are reduced and still only two bands appear (4); the non-cleaved H6-IEPD-TN123 and the correctly cleaved product, where the H6 is removed.

Figure 15 shows a schematic representation of the band pattern observed on the SDS PAGE gels in figures 2, 3, 10 and 11.

(A): When no  $\text{Ca}^{2+}$  is present the H6-IEPD-TN123 construct is cleaved at two different sites indicated by "GrB-H6  $\rightarrow$ ". The small N-terminal part cleaved off is too small to be visualized on the gel. The resulting molecule consists of two polypeptide chains held together by a disulfide bond.

(1) and (2): In a non-reducing gel the band pattern in (2) is obtained when the cleavage is not complete. (1) is the non-cleaved H6-IEPD-TN123, and in (2) the remaining non-cleaved fusion protein is the second band from the top. The top band in (2) is H6-

IEPD-TN123 cleaved at the internal site, AQP↓, giving a molecule of the same size as non-cleaved H6-IEPD-TN123, but less compact. The band at the bottom is the correctly cleaved fusion protein, whereas the third band from the top is the fusion protein cleaved twice; both at the correct IEPD↓ site and at the internal AQP↓ site. When cleaved at the internal site the molecule is less compact and therefore migrates shorter in the gel than the correctly cleaved fusion protein.

**(3) and (4):** If the samples are reduced the band pattern in (4) is observed. Here any disulfide bonds are broken, so only single polypeptide chains are seen in the gel. (3) shows the position of the non-cleaved, reduced H6-IEPD-TN123. The top band in (4) is the remaining non-cleaved H6-IEPD-TN123, while the second band from the top is the correctly cleaved and reduced H6-IEPD-TN123. Under the reducing conditions the molecules cleaved at the internal site are no longer held together by any disulfide bonds, and only the larger one of the two polypeptides after internal cleavage can be seen in the gel. Therefore the third band from the top is the larger part of the internally cleaved fusion protein, and the bottom band is this larger part after cleavage at both the internal site and at the correct IEPD↓ site.

**(B):** When 5 mM  $\text{Ca}^{2+}$  is added to the incubations, no internal cleavage is observed.  $\text{Ca}^{2+}$  ions bind to the H6-IEPD-TN123 molecule in a way preventing GrB-H6 from cleaving the fusion protein at the internal AQP↓ site. With the AQP↓ site rendered inaccessible cleavage only occurs at the correct IEPD↓ site.

**(5) and (6):** When only cleavage at the correct IEPD↓ site occurs the band pattern in (6) is seen. The position of the non-cleaved H6-IEPD-TN123 is shown in (5), and so the top band in (6) is the remaining non-cleaved H6-IEPD-TN123. The bottom band is the fusion protein cleaved only once at the correct site. The small N-terminal peptide is too small to be visualized in the gel.

Figure 16 shows samples from the incubations of three of the five H6-TripUB variants with GrB-H6. The three variants are H6-TripUB IEPD↓SP, H6-TripUB IQAD↓SP and H6-TripUB IQAD↓SG. Description of the lanes (A-P):

A: Molecular weight marker

B: H6-TripUB IEPD↓SP alone after 24 hours incubation

 O: 200  $\mu$ l H6-TripUB IQAD↓SG + 5  $\mu$ l GrB-H6 after 24 hours incubation  
 P: 200  $\mu$ l H6-TripUB IQAD↓SG + 5  $\mu$ l GrB-H6 after 48 hours incubation

In lane B is shown non-cleaved H6-TripUB IEPD↓SP, while more and more correctly cleaved product appear in lanes C-F after incubation with GrB-H6. In lane F after 48 hours incubation approximately 2/3 of the original amount of non-cleaved H6-TripUB IEPD↓SP has been correctly cleaved. In lanes G-K is shown the H6-TripUB IQAD↓SP samples giving more or less the same picture as for H6-TripUB IEPD↓SP with non-cleaved H6-TripUB IQAD↓SP in lane G and an increasing amount of correctly cleaved product in lanes H-K. The cleavage, though, is much slower than cleavage of the IEPD↓SP sequence and only a small amount has been cleaved after 48 hours incubation. For the H6-TripUB IQAD↓SG samples in lanes L-P it is evident that the cleavage is very much faster than for both H6-TripUB IEPD↓SP and H6-TripUB IQAD↓SP. Lane L shows the non-cleaved H6-TripUB IQAD↓SG and already after only 2 hours incubation the majority of the fusion protein has been cleaved to give the correct product.

Figure 17 shows samples from the incubations of two of the five H6-TripUB variants with GrB-H6. The two remaining variants are H6-TripUB VGPD↓SP and H6-TripUB VGPD↓FG. Description of the lanes (A-K):

- A: H6-TripUB VGPD↓SP alone after 24 hours incubation

- B: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ SP + 5  $\mu$ l GrB-H6 after 2 hours incubation  
 C: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ SP + 5  $\mu$ l GrB-H6 after 6 hours incubation  
 D: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ SP + 5  $\mu$ l GrB-H6 after 24 hours incubation  
 E: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ SP + 5  $\mu$ l GrB-H6 after 48 hours incubation  
 F: H6-TripUB VGPD $\downarrow$ FG alone after 24 hours incubation  
 G: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ FG + 5  $\mu$ l GrB-H6 after 2 hours incubation  
 H: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ FG + 5  $\mu$ l GrB-H6 after 6 hours incubation  
 I: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ FG + 5  $\mu$ l GrB-H6 after 24 hours incubation  
 J: 200  $\mu$ l H6-TripUB VGPD $\downarrow$ FG + 5  $\mu$ l GrB-H6 after 48 hours incubation  
 K: Molecular weight marker

In lane A is non-cleaved H6-TripUB VGPD $\downarrow$ SP and in lanes B-E more and more correctly cleaved product appears as seen for H6-TripUB IEPD $\downarrow$ SP (lanes B-F figure 16). Approximately half the amount of fusion protein has been cleaved after 48 hours. In lane F non-cleaved H6-TripUB VGPD $\downarrow$ FG is shown and in lanes G-J the correctly cleaved product of H6-TripUB VGPD $\downarrow$ FG appears. After only 2 hours incubation all the fusion protein has been correctly cleaved.

Figure 18 shows samples from the incubations of H6-TripUB IEPD $\downarrow$ SP, H6-TripUB IEPD $\downarrow$ TQ and H6-TripUB IEPD $\downarrow$ IV with GrB-H6 C228F in the protease:fusion protein ratio of 1:500 at 23 °C.

Description of lanes A-M:

- A: Molecular weight marker  
 B: H6-TripUB IEPD $\downarrow$ SP, 0 hours incubation  
 C: 250  $\mu$ l H6-TripUB IEPD $\downarrow$ SP + 1  $\mu$ l GrB-H6 C228F, 4 hours incubation  
 D: 250  $\mu$ l H6-TripUB IEPD $\downarrow$ SP + 1  $\mu$ l GrB-H6 C228F, 24 hours incubation  
 E: 250  $\mu$ l H6-TripUB IEPD $\downarrow$ SP + 1  $\mu$ l GrB-H6 C228F, 96 hours incubation  
 F: H6-TripUB IEPD $\downarrow$ TQ, 0 hours incubation  
 G: 250  $\mu$ l H6-TripUB IEPD $\downarrow$ TQ + 1  $\mu$ l GrB-H6 C228F, 4 hours incubation  
 H: 250  $\mu$ l H6-TripUB IEPD $\downarrow$ TQ + 1  $\mu$ l GrB-H6 C228F, 24 hours incubation  
 I: 250  $\mu$ l H6-TripUB IEPD $\downarrow$ TQ + 1  $\mu$ l GrB-H6 C228F, 96 hours incubation  
 J: H6-TripUB IEPD $\downarrow$ IV, 0 hours incubation

K: 250 µl H6-TripUB IEPD↓IV + 1 µl GrB-H6 C228F, 4 hours incubation

L: 250 µl H6-TripUB IEPD↓IV + 1 µl GrB-H6 C228F, 24 hours incubation

M: 250 µl H6-TripUB IEPD↓IV + 1 µl GrB-H6 C228F, 96 hours incubation

In lanes B-E the cleavage of H6-TripUB IEPD↓SP is shown (1), where the cleavage is almost 100 % complete after 96 hours. Lanes F-I are the cleavage of H6-TripUB IEPD↓TQ (2), and this is app. 100 % completed after only 24 hours. This is also the case for the cleavage of H6-TripUB IEPD↓IV (3) shown in lanes J-M. The bands for the intact and cleaved H6-TripUB IEPD↓TQ are all positioned slightly lower in the gel, than the bands for H6-TripUB IEPD↓SP, since H6-TripUB IEPD↓TQ is a deletion mutant of H6-TripUB IEPD↓SP. The bands for H6-TripUB IEPD↓IV, another deletion mutant, are positioned even lower, since the deletion is larger than the one in H6-TripUB IEPD↓TQ.

Figure 19, Panel A shows samples from the incubations of H6-TripUB IEPD↓SP and H6-TripUB IEPD↓EP with GrB-H6 C228F in the protease:fusion protein ratio of 1:500 in a total volume of 200 µl at both 21 °C and 37 °C.

Description of lanes A-O:

A: Molecular weight marker

B: H6-TripUB IEPD↓SP, 0 hours incubation

C: 24 µg H6-TripUB IEPD↓SP + 0.048 µg GrB-H6 C228F, 21 °C, 4 hours

D: 24 µg H6-TripUB IEPD↓SP + 0.048 µg GrB-H6 C228F, 21 °C, 24 hours

E: 24 µg H6-TripUB IEPD↓SP + 0.048 µg GrB-H6 C228F, 21 °C, 48 hours

F: 24 µg H6-TripUB IEPD↓SP + 0.048 µg GrB-H6 C228F, 37 °C, 4 hours

G: 24 µg H6-TripUB IEPD↓SP + 0.048 µg GrB-H6 C228F, 37 °C, 24 hours

H: 24 µg H6-TripUB IEPD↓SP + 0.048 µg GrB-H6 C228F, 37 °C, 48 hours

I: H6-TripUB IEPD↓EP, 0 hours incubation

J: 36 µg H6-TripUB IEPD↓EP + 0.072 µg GrB-H6 C228F, 21 °C, 4 hours

K: 36 µg H6-TripUB IEPD↓EP + 0.072 µg GrB-H6 C228F, 21 °C, 24 hours

L: 36 µg H6-TripUB IEPD↓EP + 0.072 µg GrB-H6 C228F, 21 °C, 48 hours

M: 36 µg H6-TripUB IEPD↓EP + 0.072 µg GrB-H6 C228F, 37 °C, 4 hours

N: 36 µg H6-TripUB IEPD↓EP + 0.072 µg GrB-H6 C228F, 37 °C, 24 hours

O: 36 µg H6-TripUB IEPD↓EP + 0.072 µg GrB-H6 C228F, 37 °C, 48 hours

The intact, non-cleaved H6-TripUB IEPD↓SP is shown in lane B (1), while the cleavages at 21 °C and 37 °C are shown in lanes C-E (2) and lanes F-H (3), respectively. There is almost no difference in the two temperatures. After 48 hours approximately 40 % has been cleaved at 21 °C. Non-cleaved H6-TripUB IEPD↓EP is shown in lane I (4), while the cleavage reactions at 21 °C and 37 °C are shown in lanes J-L (5) and lanes M-O (6), respectively. Again almost no difference between the two temperature, and after 48 hours at 21 °C approximately 35-40 % has been cleaved. i.e. the GrB-H6 C228F cleaves both substrates equally well.

Figure 19, Panel B shows samples from the incubations of H6-TripUB IEPD↓EG and H6-TripUB IEPD↓EP with GrB-H6 C228F in the protease:fusion protein ratio of 1:500 in a total volume of 200 µl at both 22 °C and 37 °C.

Description of lanes A-O:

A: Molecular weight marker

B: H6-TripUB IEPD↓EG, 0 hours incubation

C: 40 µg H6-TripUB IEPD↓EG + 0.08 µg GrB-H6 C228F, 23 °C, 6 hours

D: 40 µg H6-TripUB IEPD↓EG + 0.08 µg GrB-H6 C228F, 23 °C, 24 hours

E: 40 µg H6-TripUB IEPD↓EG + 0.08 µg GrB-H6 C228F, 23 °C, 50 hours

F: 40 µg H6-TripUB IEPD↓EG + 0.08 µg GrB-H6 C228F, 37 °C, 6 hours

G: 40 µg H6-TripUB IEPD↓EG + 0.08 µg GrB-H6 C228F, 37 °C, 24 hours

H: 40 µg H6-TripUB IEPD↓EG + 0.08 µg GrB-H6 C228F, 37 °C, 50 hours

I: H6-TripUB IEPD↓EP, 0 hours incubation

J: 38 µg H6-TripUB IEPD↓EP + 0.08 µg GrB-H6 C228F, 23 °C, 6 hours

K: 38 µg H6-TripUB IEPD↓EP + 0.08 µg GrB-H6 C228F, 23 °C, 24 hours

L: 38 µg H6-TripUB IEPD↓EP + 0.08 µg GrB-H6 C228F, 23 °C, 50 hours

M: 38 µg H6-TripUB IEPD↓EP + 0.08 µg GrB-H6 C228F, 37 °C, 6 hours

N: 38 µg H6-TripUB IEPD↓EP + 0.08 µg GrB-H6 C228F, 37 °C, 24 hours

O: 38 µg H6-TripUB IEPD↓EP + 0.08 µg GrB-H6 C228F, 37 °C, 50 hours

The intact, non-cleaved H6-TripUB IEPD↓EG is shown in lane B (1), while the cleavages at 21 °C and 37 °C are shown in lanes C-E (2) and lanes F-H (3),

respectively. There is almost no difference in the two temperatures, and after only 6 hours the cleavage has been completed. Non-cleaved H6-TripUB IQAD↓EP is shown in lane I (4), while the cleavage reactions at 21 °C and 37 °C are shown in lanes J-L (5) and lanes M-O (6), respectively. As in Figure 19 Panel A after 50 hours at 21 °C approximately 40 % has been cleaved. Surprisingly the GrB-H6 C228F cleaves the IQAD↓EG substrate much better than IQAD↓SP and IQAD↓EP.

Figure 20 shows samples from the incubation of either H6-TripUB IQAD↓SP or H6-TripUB IQAD↓SG with the six different preparations of immobilized GrB-H6 C228F, experiment A-F, described in Example 9.

Description of lanes A-M:

A: H6-TripUB IQAD↓SP + immobilized GrB-H6 C228F, experiment A

B: H6-TripUB IQAD↓SP + immobilized GrB-H6 C228F, experiment B

C: H6-TripUB IQAD↓SP + immobilized GrB-H6 C228F, experiment C

D: H6-TripUB IQAD↓SP + immobilized GrB-H6 C228F, experiment D

E: H6-TripUB IQAD↓SP + immobilized GrB-H6 C228F, experiment E

F: H6-TripUB IQAD↓SP + immobilized GrB-H6 C228F, experiment F

G: H6-TripUB IQAD↓SG + immobilized GrB-H6 C228F, experiment A

H: H6-TripUB IQAD↓SG + immobilized GrB-H6 C228F, experiment B

I: H6-TripUB IQAD↓SG + immobilized GrB-H6 C228F, experiment C

J: H6-TripUB IQAD↓SG + immobilized GrB-H6 C228F, experiment D

K: H6-TripUB IQAD↓SG + immobilized GrB-H6 C228F, experiment E

L: H6-TripUB IQAD↓SG + immobilized GrB-H6 C228F, experiment F

M: Molecular weight marker

The incubation with H6-TripUB IQAD↓SP are shown in lanes A-F (1), while the H6-TripUB IQAD↓SG incubations are shown in lanes G-L (2). The band representing non-cleaved fusion protein (H6-TripUB IQAD↓SP or H6-TripUB IQAD↓SG) is marked by (3) and the position of the bands for the correctly cleaved products are marked by (4).

## Examples

### *Example 1*

#### **Design and construction of human Granzyme B expression vectors**

In order to prepare inactive pro-Granzyme B constructs, a sequence encoding activated human Granzyme B (E.C. 3.4.21.79), i.e. from Ile21 (Ile16 in chymotrypsinogen numbering) to Tyr246, was cloned into a pT7 cloning vector containing a hexa-His tag (H6) C-terminally (pT7 C-term H6), resulting in the expression vector pT7-IEGR-GrB-H6. The sequence, MGSIEGR, containing the blood clotting factor X<sub>a</sub> (FX<sub>a</sub>) recognition sequence IEGR was thereby placed just N-terminally to Ile21 in Granzyme B providing a FX<sub>a</sub> cleavage site between Arg (R) and Ile21. The resulting fusion protein pro-Granzyme B containing the FX<sub>a</sub> recognition sequence and the C-terminal hexa-His tag is in the following referred to as pro-IEGR-GrB-H6 and is shown in SEQ ID NO:1.

In order to form self-activating pro-Granzyme B proteins, the expression vectors pT7-IEPD-GrB-H6 and pT7-IEAD-GrB-H6 were constructed, wherein the FX<sub>a</sub> recognition sequence of IEGR was substituted with the Granzyme B recognition sites IEPD or IEAD, respectively. The resulting self-activating GrB proteins are in the following referred to as pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6, respectively and are shown in SEQ ID NO:2 and SEQ ID NO:3. The design and cloning of the vectors is outlined in the following section.

The presence of a free cysteine at amino acid position 228 (using the established standard chymotrypsinogen amino acid numbering system) in human Granzyme B, and in particular in the above described Granzyme B proteins, pro-IEGR-GrB-H6, pro-IEPD-GrB-H6, and pro-IEAD-GrB-H6, has the potential to cause complications during the refolding process described in Example 2, decrease stability of the activated enzyme and provide higher non-enzymatic reactivity towards disulfide containing substrates. Therefore a number of recombinant mutant proteins based on pro-IEPD-GrB-H6 were generated in which the Cys228 amino acid residue (chymotrypsinogen amino acid numbering) was substituted with serine (S), alanine (A), threonine (T), valine (V), or phenylalanine (F) by site-directed mutation of the construct pT7-IEPD-

GrB-H6, giving the expression vectors pT7-IEPD-GrB-H6 C228S, pT7-IEPD-GrB-H6 C228A, pT7-IEPD-GrB-H6 C228T, pT7-IEPD-GrB-H6 C228V, and pT7-IEPD-GrB-H6 C228F, respectively. The resulting mutant proteins are in the following referred to as pro-IEPD-GrB-H6 C228S (SEQ ID NO 4), pro-IEPD-GrB-H6 C228A (SEQ ID NO 5), pro-IEPD-GrB-H6 C228T (SEQ ID NO 6), pro-IEPD-GrB-H6 C228V (SEQ ID NO 7), and pro-IEPD-GrB-H6 C228F (SEQ ID NO 8), respectively, and collectively referred to as the pro-IEPD-GrB-H6 C228X mutants. All of these mutants were constructed as self-activating Granzyme B proteases.

#### Construction of the pT7 C-term H6 cloning vector

The cloning vector pT7 C-term H6, was constructed by ligation of the DNA fragment made from the oligonucleotide primers H6 C-term fw (SEQ ID NO: 9) and H6 C-term rev (SEQ ID NO: 10) into an *NcoI* and *EcoRI* cut vector, pT7 (Christensen JH et al., 1991), using standard procedures.

#### Cloning of human Granzyme B into pT7 C-term H6 cloning vector

The expression vector pT7-IEGR-GrB-H6, was constructed by ligation of the *Bam*HI and *Eco*RI restricted DNA fragment GrB *Eco*RI amplified from a mixture of cDNA, isolated from human bone marrow, human leukocyte, human lymphnodes, and lymphoma (Raji) cells (Clontech Laboratories, Inc cat # 7181-1, 7182-1, 7164-1, 7167-1) (with the oligonucleotide primers GrBfw (SEQ ID NO: 11) and GrBrev *Eco*RI (SEQ ID NO: 12)) into a *Bam*HI and *Eco*RI cut vector, pT7 C-term H6, using standard procedures. Outlines of the resulting nucleotide sequence of GrB *Eco*RI, is given as SEQ ID NO: 13.

#### Construction of expression vectors for self-activating human Granzyme B, pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6

The expression vectors pT7-IEPD-GrB-H6 and pT7-IEAD-GrB-H6 encoding the self-activating pro-Granzyme B proteins, were constructed by using the QuikChange<sup>TM</sup> Site-Directed Mutagenesis Kit (STRATAGENE, Catalog #200518) according to the manufacturers' protocol. The expression vector pT7-IEGR-GrB-H6 was used as

template. The oligonucleotide primers GrB GR-PD fw and GrB GR-PD rev (SEQ ID NO: 14 and 15) were used for construction of pT7-IEPD-GrB-H6 and the oligonucleotide primers GrB GR-AD fw and GrB GR-AD rev (SEQ ID NO: 16 and 17) were used for construction of pT7-IEAD-GrB-H6.

### Construction of expression vectors for the self-activating pro-IEPD-GrB-H6 C228X mutants

The expression vectors pT7-IEPD-GrB-H6 C228X encoding the self-activating pro-GrB-H6 C228X mutant proteins, were all constructed by using the QuikChange™ Site-Directed Mutagenesis Kit (STRATAGENE, Catalog #200518) according to the manufacturers' protocol. The expression vector pT7-IEPD-GrB-H6 was used as template. The degenerated oligonucleotide primers GrB SAT fw and GrB SAT rev (SEQ ID NO: 18 and 19) were used for construction of pT7-IEPD-GrB-H6 C228S, pT7-IEPD-GrB-H6 C228A, and pT7-IEPD-GrB-H6 C228S, where D = A, G, or T and H = T, C, or A in the GrB SAT fw and GrB SAT rev primer sequences shown in Table 1. The degenerated oligonucleotide primers GrB VF fw and GrB VF rev (SEQ ID NO: 20 and 21) were used for construction of pT7-IEPD-GrB-H6 C228V and pT7-IEPD-GrB-H6 C228F, where K = G or T and M = A or C in the GrB VF fw and GrB VF rev primer sequences shown in Table 1.

## Example 2

### Expression and refolding of self-activating human Granzyme B

#### FX<sub>a</sub> activateable recombinant Pro-IEGR-GrB-H6

The FX<sub>a</sub> activateable recombinant pro-Granzyme B fusion protein pro-IEGR-GrB-H6 (SEQ ID NO:1) was produced by growing and expressing the expression vector pT7-IEGR-GrB-H6 prepared in Example 1 in *E. coli* BL21 cells in a medium scale (3x1 litre) as described by Studier FW et al. (1990). Exponentially growing cultures at 37°C were at OD<sub>600</sub> = 0.8 infected with bacteriophage λCE6 at a multiplicity of approximately 5. Cultures were grown at 37°C and 50 min after infection 0.1 g/L rifampicin (dissolved as 0.1 g/mL in methanol) was added. After another three hours at 37°C the cells were harvested by centrifugation. The cells were lysed by osmotic shock and sonification and total cellular protein was extracted into phenol (adjusted to pH 8 with Trisma base). The protein was precipitated from the phenol phase by addition of 2.5 volumes of ethanol and centrifugation. The protein pellet was dissolved in a buffer containing 6 M guanidinium chloride, 50 mM Tris-HCl pH 8, and 100 mM dithiothreitol. Following gel-filtration on Sephadex<sup>TM</sup> G-25 Fine (Amersham Biosciences) into 8 M Urea, 0.5 M NaCl, 50 mM Tris-HCl pH 8, and 5 mM 2-mercaptoethanol, the crude protein preparation was applied onto a Ni<sup>2+</sup>-activated NTA-agarose column (Ni<sup>2+</sup>-NTA-agarose, Quiagen).

Upon application of the crude protein extract onto the Ni<sup>2+</sup>-NTA-agarose column, the fusion protein, pro-IEGR-GrB-H6 was purified from the majority of *E. coli* and λ phage proteins by washing with one column volume of the loading buffer followed by one

column volume of 8 M Urea, 0.5 M NaCl, 50 mM sodium phosphate pH 6.3 and 5 mM 2-mercaptoethanol, ½ column volume of 6 M guanidinium chloride, 50 mM Tris-HCl pH 8, and 5 mM 2-mercaptoethanol and finally ½ column volume of 8 M Urea, 0.5 M NaCl, 50 mM Tris-HCl pH 8, and 3 mM reduced glutathione.

The pro-IEGR-GrB-H6 fusion protein was refolded on the Ni<sup>2+</sup>-NTA-agarose column using the cyclic refolding procedure described by Thøgersen et al. (International Patent Application WO 9418227). The gradient manager profile is described in the below Table 2 with 0.5 M NaCl, 50 mM Tris-HCl pH 8, 2 mM reduced glutathione, and 0.2 mM oxidized glutathione as buffer A and 6 M urea, 0.5 NaCl, 50 mM Tris-HCl pH 8, and 3 mM reduced glutathione as buffer B.

Table 2:

Step	Time (min)	Flow (mL/min)	% A	% B

After completion of the cyclic refolding procedure, the pro-IEGR-GrB-H6 fusion protein was eluted from the  $\text{Ni}^{2+}$ -NTA-agarose column with a buffer containing 0.5 M NaCl, 50 mM Tris-HCl pH 8, and 10 mM EDTA pH 8.

After elution from the  $\text{Ni}^{2+}$ -NTA column the pro-IEGR-GrB-H6 protein was diluted with 1 volume of 50 mM Tris-HCl pH 8.0 before the pH was adjusted to 7 with HCl. The protein was then applied onto a SP Sepharose™ Fast Flow (Amersham Biosciences) ion exchange column. The protein was eluted over 10 column volumes with a linear gradient from 250 mM NaCl, 50 mM Tris-HCl pH 7.0 to 1 M NaCl, 50 mM Tris-HCl pH 7.0. Samples from the elution profile appear as a single distinct band in SDS-PAGE analysis and migrate with the anticipated molecular weight of 27.4 kDa for monomeric pro-IEGR-GrB-H6.

#### Self-activating pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6

The self-activating recombinant Granzyme B fusion proteins pro-IEPD-GrB-H6 (SEQ ID NO:2) and pro-IEAD-GrB-H6 (SEQ ID NO:3) were produced by expression from the vectors pT7-IEPD-GrB-H6 and pT7-IEAD-GrB-H6 prepared in Example 1, where the expression, refolding, and purification was performed essentially as described for pro-IEGR-GrB-H6 above.

The self activation of the two enzymes, pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6 was followed as described in Example 3 below.

#### Self-activating pro-IEPD-GrB-H6 C228X mutants

All the pro-IEPD-GrB-H6 C228X mutants (SEQ ID NOS. 4, 5, 6, 7 and 8) were expressed from the pT7-IEPD-GrB-H6 C228X expression vectors essentially as described for the expression of pro-IEGR-GrB-H6 above. Refolding of the pro-IEPD-GrB-H6 C228X mutants were also done essentially as described for pro-IEGR-GrB-H6 above, and activation on a cation exchange column was done as described above for pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6.

Purification and complete activation of the self-activating pro-IEPD-GrB-H6 C228X mutants was done in only four hours by applying the refolded protein, still in the pro-form, to a cation exchange column, SP Sepharose<sup>TM</sup> Fast Flow (Amersham Biosciences), washing for four hours with 250 mM NaCl, 50 mM TrisHCl, pH 7.0, and finally eluting the activated protein with 750 mM NaCl, 50 mM TrisHCl, pH 7.0. After elution the activated mutants are referred to as GrB-H6 C228S, GrB-H6 C228A, GrB-H6 C228T, GrB-H6 C228V, and GrB-H6 C228F.

Expression levels of the pro-IEPD-GrB-H6 C228X mutants were similar to the pro-IEPD-GrB-H6 expression level. However, refolding efficiency differed by up to 90% relative to that of pro-IEPD-GrB-H6. One mutant, pro-IEPD-GrB-H6 C228S, had a very low refolding efficiency and was therefore not analyzed further. This is contrary to what would be expected as the obvious conservative choice for substitution of a Cysteine residue would be Serine, since Serine most closely resembles Cysteine of all the amino acids naturally occurring in proteins, both in size, hydrophilicity and chemically.

The refolding efficiency of three of the other mutants, pro-IEPD-GrB-H6 C228A, pro-IEPD-GrB-H6 C228T, and pro-IEPD-GrB-H6 C228V was similar to that of pro-IEPD-GrB-H6.

A highly interesting finding was that higher protein recovery after refolding and purification was obtained for the pro-IEPD-GrB-H6 C228F mutant, wherein Cysteine had been replaced with Phenylalanine, than was the case for non-mutated pro-IEPD-GrB-H6 comprising the Cys228 amino acid residue. Thus, when 70 mg, estimated by Bradford assay (Coomassie® Plus Protein Assay Reagent Kit, Pierce Biotechnology) using bovine serum albumin as protein standard, of either the pro-IEPD-GrB-H6 C228F or the non-mutated pro-IEPD-GrB-H6 was applied to the above described refolding and purification procedure, the final yield (protein recovery) was found to be 1.5% and 0.5%, respectively. This clearly shows that the mutated pro-IEPD-GrB-H6 C228F provides for improved final protein recovery yields. The reasoning for the lower recovery yield may be that when the non-mutated pro-IEPD-GrB-H6 protein was applied for purification and activation by cation exchange chromatography the protein apparently tended to precipitate and thus reduced the final yield (recovery) of active

enzyme. No significant precipitation was observed for pro-IEPD-GrB-H6 C228F. Therefore, substitution of Cysteine 228 with Phenylalanine appears to be favourable for Granzyme B, in particular for self-activating Granzyme B. This is highly surprising, as the amino acid Phenylalanine is chemically very dissimilar to Cysteine and would not normally be the choice for a Cysteine substitution.

In the following examples we therefore focused on the C228F mutant, pro-IEPD-GrB-H6 C228F, along with pro-IEGR-GrB-H6 for comparison.

### ***Example 3***

#### **Activation of pro-IEGR-GrB-H6 fusion protein using purified bovine Factor X<sub>a</sub> and self-activation of pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6**

##### **Activation of pro-IEGR-GrB-H6 by Factor X<sub>a</sub>**

A sample of monomeric inactive pro-IEGR-GrB-H6 produced as described in Example 2, was taken directly from the eluate from the SP Sepharose ion exchange. One mg of pro-IEGR-GrB-H6 (in app. 10 ml) was activated by the addition of 50 µg FX<sub>a</sub> (50 µl of 1 mg/ml) and incubated at room temperature for several days. The degree of cleavage/activation of pro-IEGR-GrB-H6 by FX<sub>a</sub>, resulting in GrB-H6, was estimated by SDS PAGE.

In addition, the Granzyme B activity during an incubation of pro-IEGR-GrB-H6 with FX<sub>a</sub> was followed for several days using the following colorimetric assay: 500 µl buffer (100 mM NaCl, 50 mM Tris-HCl pH 8.0), 4 µl 100 mM Ac-IEPD-pNA, and 5 µl incubation mixture. The incubation mixture was prepared by mixing 100 µl pro-IEGR-GrB-H6 (approximately 10 µg) with 1 µl FX<sub>a</sub> (1 mg/ml) and kept at 4°C during the incubation. The results are summarised in Table 3 and Figure 1.

Table 3:

Time	Time (hours)	$\Delta OD_{405}/\text{min}$
0 hours	0	0.0073
2 hours	2	0.0200
5 hours	5	0.0250
19 hours	19	0.0829
2 days	45	0.1325
5 days	120	0.1832

To remove the added  $FX_a$  the incubation mixture was loaded onto a SP Sepharose<sup>TM</sup> Fast Flow (Amersham Biosciences) ion exchange column washed in 250 mM NaCl, 50 mM Tris-HCl pH 7.0. The  $FX_a$  did not bind to the column material, while the resulting GrB-H6 was eluted from the column with 750 mM NaCl, 50 mM Tris-HCl pH 7.0.

#### Colorimetric activity measurements

To determine whether the added  $FX_a$  had been properly removed from the incubation mixture, both the GrB-H6 and the  $FX_a$  activity was measured before and after removal of the added  $FX_a$  using a colorimetric assay with the substrates S2222 (N-Benzoyl-L-isoleucyl-L-glutamyl-glycyl-L-arginine-*p*-nitroaniline, Chromogenix, Italy, cat. no. S2222) and Ac-IEPD-*p*NA (N-acetyl-L-isoleucyl-L-glutamyl-L-prolyl-L-aspartyl-*p*-nitroaniline, Calbiochem, La Jolla, USA, cat. no. 368067), where the absorbance was measured at 405 nm for approximately 3 minutes, and the  $\Delta OD_{405}/\text{min}$  was calculated.  $FX_a$  activity was measured using the following mix: 500  $\mu\text{l}$  buffer, 25  $\mu\text{l}$  3 mM S2222, and 5  $\mu\text{l}$   $FX_a$ . GrB-H6 activity was measured using the following mix: 500  $\mu\text{l}$  buffer, 2  $\mu\text{l}$  100 mM Ac-IEPD-*p*NA, and 5  $\mu\text{l}$  GrB-H6.

The buffer used was either 100 mM NaCl, 50 mM Tris-HCl pH 8.0 or 100 mM HEPES pH 7.4. An example using the 100 mM NaCl, 50 mM Tris-HCl pH 8.0 buffer is shown below in Table 3, where the top fraction from the SP Sepharose eluate after  $FX_a$  removal was used:

Table 4:

Before FX <sub>a</sub> removal ( $\Delta OD_{405}/\text{min}$ )		After FX <sub>a</sub> removal ( $\Delta OD_{405}/\text{min}$ )	
GrB activity	FX <sub>a</sub> activity	GrB activity	FX <sub>a</sub> activity
0.1401	0.0139	0.2213	0.0001

As can be seen from the above Table 4, the added FX<sub>a</sub> was completely removed from the activation mixture by ion exchange on SP Sepharose<sup>TM</sup> Fast Flow column. The same result was obtained with the buffer comprising 100 mM HEPES pH 7.4.

#### Self-activation of pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6

Recombinant self-activating human Granzyme B derivatives IEPD-GrB-H6 and IEAD-GrB-H6 were produced as described in Example 2 by using the expression vectors pT7-IEPD-GrB-H6 and pT7-IEAD-GrB-H6 described in Example 1. The IEAD-GrB-H6 and IEPD-GrB-H6 proteins were eluted from the SP Sepharose columns and stored at 4° C for 2 days before the activity of the respective top fractions were determined by using a colorimetric assay. For this purpose the following was mixed: 500  $\mu\text{l}$  buffer (100 mM HEPES pH 7.5), 2  $\mu\text{l}$  100 mM Ac-IEPD-pNA, and 5  $\mu\text{l}$  protein solution. The change in absorption was then determined at 405 nm during 3 min. The activity was further determined after additional incubation for 1 and 2 days at 4°C. The results are summarised in Table 5.

Table 5:

Protein		$\Delta OD_{405}/\text{min}$
IEAD-GrB-H6	2 days	0.1372
IEPD-GrB-H6	2 days	0.1284
IEAD-GrB-H6	3 days	0.1607
IEPD-GrB-H6	3 days	0.1375
IEAD-GrB-H6	4 days	0.1983
IEPD-GrB-H6	4 days	0.1351

As can be seen from the Table 5, the self-activating derivatives pro-IEPD-GrB-H6 and pro-IEAD-GrB-H6 were activated without addition of any previously activated

Granzyme B and the self-activation was not completed until after a least three or four days at 4°C.

#### **Example 4**

##### **Granzyme B activity determined on small chromogenic peptide substrate**

The activity of the activated and purified GrB-H6 was measured in different buffers using the Ac-IEPD-pNA substrate: 500 µl buffer, 2 µl 100 mM Ac-IEPD-pNA, and 5 µl GrB-H6. The  $\Delta OD_{405}/\text{min}$  was calculated from the first 0.75 min unless otherwise noted.

Table 6:

Buffer	Approximate amount Of GrB-H6 added (µg)	Activity ( $\Delta OD_{405}/\text{min}$ )
TN pH 8.1	1	0.2213 (1 min)
TN pH 7.0	1	0.2794
TN pH 7.4	1	0.2930
		0.2624
	0.5	0.0835
		0.1082
TN pH 7.4 + 0.1% TWEEN20	0.2	0.0245 (3 min)
	0.5	0.0887
TN pH 7.4 + 5 mM $\text{Ca}^{2+}$	0.2	0.0303 (3 min)
	0.5	0.1401
TN pH 7.4 + 5 mM $\text{Mg}^{2+}$	0.5	0.1491
100 mM HEPES pH 7.5	0.5	0.2350
100 mM HEPES pH 7.5 + 5 mM $\text{Ca}^{2+}$	0.5	0.2425
100 mM HEPES pH 7.2	0.5	0.1970
100 mM HEPES pH 7.4	0.5	0.2273
		0.2328
100 mM HEPES pH 7.4 + 50 mM KCl	0.5	0.2167

Buffer	Approximate amount Of GrB-H6 added ( $\mu\text{g}$ )	Activity ( $\Delta\text{OD}_{405}/\text{min}$ )
100 mM HEPES pH 7.4 + 50 mM NaCl	0.5	0.1993 0.1938
100 mM NaCl, 50 mM Tris-HCl pH 7.4	0.5	0.1682
50 mM NaCl, 25 mM Tris-HCl pH 7.4	0.5	0.1948
100 mM KCl, 50 mM Tris-HCl pH 7.4	0.5	0.1662

TN = 100 mM NaCl, 50 mM Tris-HCl

As can be seen from the above Table 6, 100 mM HEPES pH 7.4 - 7.5 was the best buffer for GrB-H6 activity of the buffers evaluated.

In a later pH scanning experiment performed with GrB-H6 C228F the optimum pH for activity towards the substrate Ac-IEPD-pNA was found to be in the range of pH 7.5 - 7.8 in 100 mM HEPES.

To estimate the steady state kinetic parameters  $K_M$  and  $k_{cat}$ , the same colorimetric assay as described above was used with a total volume of 500  $\mu\text{l}$  in the assay cuvette. The assay buffer was 100 mM HEPES pH 7.75, and both GrB-H6 and GrB-H6 C228F were used in a concentration of 20 nM in each measurement. To construct a Lineweaver-Burk plot the following substrate concentrations were used: 5, 40, 150, 300, and 600  $\mu\text{M}$ . The obtained results are shown in Table 7 below:

Table 7:

	GrB-H6	GrB-H6 C228F
$K_M$ ( $\mu\text{M}$ )	66.9	27.0
$k_{cat}$ ( $\text{s}^{-1}$ )	5.03	4.85
$k_{cat}/K_M$ ( $10^4 \text{ s}^{-1}\text{M}^{-1}$ )	7.5	18.0

The obtained values for  $K_M$ ,  $k_{cat}$  and  $k_{cat}/K_M$  shown in the above Table 7 for GrB-H6 and GrB-H6 C228F are very similar to the values found for a recombinant rat GrB (Harris J.L. et al., 1998.)

## **Example 5**

### **Estimation of the specificity of GrB-H6 and GrB-H6 C228F and the stability of GrB-H6 C228F**

#### The specificity of GrB-H6 and GrB-H6 C228F

The specificity of both the GrB-H6 and the GrB-H6 C228F protease was examined using the chromogenic substrates Ac-LEED-pNA, Ac-VEID-pNA, Ac-YVAD-pNA, and Ac-DEVD-pNA, in addition to the Ac-IEPD-pNA substrate applied in Example 4. The activity assay was again carried out in 500  $\mu$ l 100 mM HEPES pH 7.75 with a substrate concentration of 400  $\mu$ M. For each measurement 1  $\mu$ g of protease was added to the assay cuvette. All measurements were done in triplicate, and the activities obtained were normalized by setting the activity measured on Ac-IEPD-pNA to 100 %. The results are shown in Figure 2. It can be seen that the GrB-H6 protease is at least as specific as the GrB-H6 C228F protease.

#### The stability of GrB-H6 C228F

In order to determine the stability of the GrB-H6 C228F protease, samples of GrB-H6 C228F was incubated in 100 mM HEPES pH 7.4 for 15 days at 4°C, 23°C and 37°C. The 100 mM HEPES buffer was chosen in order to examine any auto-cleavage and degradation, but no significant "cannibalism" was observed as assessed by SDS PAGE (see Figure 3A). The hydrolytic activity towards the chromogenic substrate Ac-IEPD-pNA was also measured during this incubation period, see Figure 3B.

The GrB-H6 C228F protease is remarkably stable at 4°C and 23°C. The activity only falls slightly with approximately 10% at 23°C during the 15 days, and almost no degradation fragments are visible in the gel. Even at 37°C there is still about 20% activity left after 15 days, and only very few degradation fragments show up in the gel.

It has also been found that the GrB-H6 C228F protease on a short time scale of 10 minutes is stable up to 50°C (not shown here). In this experiment a sample of the protease was incubated for 10 minutes at a given temperature and then returned to

room temperature by 10 minutes incubation at 23°C. The activity towards Ac-IEPD-pNA was then measured at 23°C. Up to the incubation temperature of 50°C the protease can revert back to almost 100% activity after incubation at room temperature (23°C), but after exposure to a temperature above 50°C the protease can no longer revert to an active form, and only very little activity can be detected.

### ***Example 6***

#### **Design and construction of expression vectors for fusion proteins containing a recognition sequence cleavable by GrB-H6 and GrB-H6 C228F**

In order to prepare suitable fusion proteins as substrates for GrB-H6 and GrB-H6 C228F, the FX<sub>a</sub> recognition sequence in the FX<sub>a</sub> cleavable fusion proteins H6-FX-TripBUB, H6-IEGR-RAP, H6Ubi-IEGR-ApoA1, and H6-FX-TN123 (encoded by pT7H6-FX-TripBUB, pT7H6-FX-RAP, pT7H6Ubi-FX-ApoA1, and pT7H6-FX-TN123, respectively) was changed from either IEGR or IQGR to IEPD, giving the constructs H6-TripUB IEPD↓SP (SEQ ID NO. 22), H6-IEPD-RAP (SEQ ID NO. 23), H6Ubi-IEPD-ApoA1 (SEQ ID NO. 24), and H6-IEPD-TN123 (SEQ ID NO. 25).

In the construct H6-TripUB IEPD↓SP the Granzyme B recognition sequence is IEPD↓SP, where ↓ indicates the cleavage site. This recognition sequence is located between the H6 and the TripUB moiety of the construct, where the two residues, SP, C-terminal to the scissile bond are the N-terminal part of the TripUB moiety.

The recognition sequence in the following H6-TripUB fusion proteins (termed the H6-TripUB variants) is indicated as the last part of their name, as XXXX↓YY, wherein XXXX is the part of the Granzyme B recognition sequence between the hexa-His moiety H6 and the TripUB moiety, and wherein the YY residues are a part of the TripUB moiety.

The IEPD↓SP cleavage site in the H6-TripUB IEPD↓SP construct was changed to eight other cleavage sites to give the following variants: H6-TripUB IQAD↓SP (SEQ ID

NO. 26), H6-TripUB IQAD↓SG (SEQ ID NO. 27), H6-TripUB VGPD↓SP (SEQ ID NO. 28), H6-TripUB VGPD↓FG (SEQ ID NO. 29), H6-TripUB IEPD↓TQ (SEQ ID NO. 30), H6-TripUB IEPD↓IV (SEQ ID NO. 31), H6-TripUB IEPD↓EP (SEQ ID NO. 32), and H6-TripUB IEPD↓EG (SEQ ID NO. 33), where ↓ indicates the cleavage site. In six of these eight constructs the P<sub>1</sub>' and P<sub>2</sub>'-sites (both part of the TripUB moiety) of the fusion protein were changed, namely in H6-TripUB IQAD↓SG, H6-TripUB VGPD↓FG, H6-TripUB IEPD↓TQ, H6-TripUB IEPD↓IV, H6-TripUB IEPD↓EP, and H6-TripUB IEPD↓EG.

#### Construction of fusion protein expression vectors

The expression vector pT7H6-TripUB IEPD↓SP was constructed by using the QuikChange™ Site-Directed Mutagenesis Kit (STRATAGENE, Catalog #200518) according to the manufacturers' protocol with the vector pT7H6-FX-TripBUB (International Patent Application WO 9856906) as template and the oligonucleotide primers: TripUB GrB fw (SEQ ID NO: 34) and TripUB GrB rev (SEQ ID NO: 35).

The expression vector pT7H6-IEPD-RAP was constructed by site-directed mutagenesis as described above with the vector pT7H6-FX-RAP (Nykjær et al., 1992) as template and the oligonucleotide primers: RAP GrB fw (SEQ ID NO: 36) and RAP GrB rev (SEQ ID NO: 37).

The expression vector pT7H6Ubi-IEPD-ApoA1 was constructed by site-directed mutagenesis as described above with the vector pT7H6Ubi-FX-ApoA1 (International Patent Application WO0238609) as template and the oligonucleotide primers: Mut-GrB fw (SEQ ID NO: 38) and Mut-GrB rw (SEQ ID NO: 39).

The expression vector pT7H6-IEPD-TN123 was constructed by site-directed mutagenesis as described above with the vector pT7H6-FX-TN123 (Holtet et al., 1997) as template and the oligonucleotide primers: TN GrB fw (SEQ ID NO: 40) and TN GrB rev (SEQ ID NO: 41).

The expression vector pT7H6-TripUB IQAD↓SP was constructed by using site-directed mutagenesis as described above with the vector pT7H6-FX-TripBUB (WO 9856906) as template and the oligonucleotide primers: PC7TripUB GR-AD fw (SEQ ID NO: 42) and PC7TripUB GR-AD rev (SEQ ID NO: 43).

The expression vector pT7H6-TripUB IQAD↓SG was constructed by using site-directed mutagenesis as described above with the vector pT7H6-TripUB IQAD↓SP as template and the oligonucleotide primers: PC7TripUB P-G fw (SEQ ID NO: 44) and PC7TripUB P-G rev (SEQ ID NO: 45).

The expression vector pT7H6-TripUB VGPD↓SP was constructed by using site-directed mutagenesis as described above with the vector pT7H6-TripUB IEPD↓SP as template and the oligonucleotide primers: DNATrip IE-VG fw (SEQ ID NO: 46) and DNATrip IE-VG rev (SEQ ID NO: 47).

The expression vector pT7H6-TripUB VGPD↓FG was constructed by using site-directed mutagenesis as described above with the vector pT7H6-TripUB VGPD↓SP as template and the oligonucleotide primers: DNATrip SP-FG fw (SEQ ID NO: 48) and DNATrip SP-FG rev (SEQ ID NO: 49).

The expression vector pT7H6-TripUB IEPD↓TQ was constructed by a PCR reaction with the vector pT7H6-TripUB IEPD↓SP as template and the oligonucleotide primers: Trip IEPD-TQ (SEQ ID NO: 50) and UB3 (SEQ ID NO: 52). The resulting PCR product was digested with BamHI and HindIII and ligated into a BamHI-HindIII cut pT7H6(GS)3 vector (Christensen J.H et al. 1991).

The expression vector pT7H6-TripUB IEPD↓IV was constructed by a PCR reaction with the vector pT7H6-TripUB IEPD↓SP as template and the oligonucleotide primers: Trip IEPD-IV (SEQ ID NO: 51) and UB3 (SEQ ID NO: 52). The resulting PCR product was digested with BamHI and HindIII and ligated into a BamHI-HindIII cut pT7H6(GS)3 vector (Christensen J.H et al. 1991).

The expression vector pT7H6-TripUB IEPD↓EP was constructed by using site-directed mutagenesis as described above with the vector pT7H6-TripUB IEPD↓SP as template and the oligonucleotide primers: TripUB EP fw (SEQ ID NO: 53) and TripUB EP rev (SEQ ID NO: 54).

The expression vector pT7H6-TripUB IEPD↓EG was constructed by using site-directed mutagenesis as described above with the vector pT7H6-TripUB IEPD↓EP as template and the oligonucleotide primers: TripUB EG fw (SEQ ID NO: 55) and TripUB EG rev (SEQ ID NO: 56).

Table 8: Oligonucleotide primers

Primer	Nucleotide sequence	SEQ ID NO.

### Example 7

#### Expression, purification and refolding of fusion proteins containing a recognition sequence cleavable by GrB-H6 and GrB-H6 C228F

##### Expression of the fusion proteins

To prepare the chimeric fusion proteins H6-TripUB IEPD↓SP, H6-IEPD-RAP, H6-IEGR-RAP, H6Ubi-IEPD-ApoA1, H6Ubi-IEGR-ApoA1, H6-IEPD-TN123 and the H6-TripUB variants, the expression vectors pT7H6-TripUB IEPD↓SP, pT7H6-IEPD-RAP, pT7H6-FX-RAP, pT7H6Ubi-IEPD-ApoA1, pT7H6Ubi-IEGR-ApoA1, pT7H6-IEPD-TN123, pT7H6-TripUB IQAD↓SP, pT7H6-TripUB IQAD↓SG, pT7H6-TripUB VGPD↓SP, pT7H6-TripUB VGPD↓FG, pT7H6-TripUB IEPD↓TQ, pT7H6-TripUB IEPD↓IV, pT7H6-TripUB IEPD↓EP, and pT7H6-TripUB IEPD↓EG (the last eight termed H6-TripUB variants) were grown in a medium scale (3 litre; 2xTY medium, 5 mM MgSO<sub>4</sub> and 0.1 mg/ml ampicillin) in *E. coli* BL21 cells, as described by Studier FW et al. (1990). Exponentially growing cultures at 37°C were at OD<sub>600</sub> = 0.8 infected with bacteriophage λCE6 at a multiplicity of approximately 5. Cultures were grown at 37°C for another four hours and the cells harvested by centrifugation. Cells were re-suspended in 100 ml of 750 mM NaCl, 100 mM Tris-HCl pH 8, and 1 mM EDTA pH 8. Phenol (150 ml adjusted to pH 8 with Trisma base) was added to each, and the mixtures were sonicated to extract total protein. After clarification by centrifugation (25 minutes at 10.000 g) crude protein fractions were precipitated from the phenol phases by addition of 2.5 volumes of 96 % ethanol and centrifugation. Protein pellets were

dissolved in 75 ml 6 M guanidinium chloride, 50 mM Tris-HCl pH 8, and 100 mM dithiothreitol (DTT).

Purification of H6-TripUB IEPD↓SP, H6-IEPD-RAP, H6-IEGR-RAP, H6Ubi-IEPD-ApoA1, H6Ubi-IEPD-ApoA1 and H6-TripUB variants

Following gel-filtration on Sephadex™ G-25 Fine (Amersham Biosciences) into 8 M Urea, 500 mM NaCl, 50 mM Tris-HCl pH 8, and 10 mM 2-mercaptoethanol, the crude protein preparations of the H6-IEPD-TripUB and H6-IEPD-RAP fusion proteins were applied by batch adsorption onto Ni<sup>2+</sup> activated NTA-agarose (Ni<sup>2+</sup>-NTA-agarose, Quiagen) columns (usually 50-75 ml column volume) for purification (Hochuli E et al., 1988). The column was washed with the following:

1. 2 x column volume 8 M urea, 500 mM NaCl, 50 mM Tris-HCl pH 8, and 10 mM 2-mercaptoethanol
2. 1 x column volume 8 M urea, 500 mM NaCl, 50 mM sodium-phosphate pH 6.3, and 10 mM 2-mercaptoethanol
3. 1 x column volume 6 M guanidinium chloride, and 50 mM Tris-HCl pH 8, and 10 mM 2-mercaptoethanol
4. 2 x column volume 500 mM NaCl, and 50 mM Tris-HCl pH 8

The purified fusion proteins were then eluted with 500 mM NaCl, 50 mM Tris-HCl pH 8, and 10 mM EDTA.

Purification and refolding of H6-IEPD-TN123 fusion proteins

Following gel-filtration on Sephadex™ G-25 Fine (Amersham Biosciences) into 8 M Urea, 500 mM NaCl, 50 mM Tris-HCl pH 8, and 10 mM 2-mercaptoethanol, the crude protein preparations of the H6-IEPD-TN123 fusion proteins were applied by batch adsorption to Ni<sup>2+</sup> activated NTA-agarose (Ni<sup>2+</sup>-NTA-agarose, Quiagen) columns (usually 50-75 ml column volume) for purification and in vitro refolding. The column was washed with the following:

1. 2 x column volume 8 M urea, 500 mM NaCl, 50 mM Tris-HCl pH 8, and 10 mM 2-mercaptoethanol
2. 1 x column volume 8 M urea, 500 mM NaCl, 50 mM sodium-phosphate pH 6.3, and 10 mM 2-mercaptoethanol

3. 1 x column volume 6 M guanidinium chloride, 50 mM Tris-HCl pH 8, and 10 mM 2-mercaptoethanol

Each fusion protein was then subjected to the iterative refolding procedure as described for plasminogen kringle 4 by Thøgersen et al. (International Patent Application WO 9418227). After completion of the refolding procedure each refolded fusion protein was then eluted from the  $\text{Ni}^{2+}$ -NTA-agarose in 500 mM NaCl, 50 mM Tris-HCl pH 8, 10 mM EDTA.

Fractions of each refolded fusion protein was gel filtrated into 50 mM NaCl, 25 mM sodium acetate pH 5.0, and 1 mM  $\text{CaCl}_2$ , and was further purified by ion exchange chromatography on SP Sepharose<sup>TM</sup> Fast Flow (Amersham Biosciences, 1.6 (i.d.) by 20 centimetre column) using a salt gradient from 50 mM NaCl, 25 mM sodium acetate pH 5.0 and 1 mM  $\text{CaCl}_2$  to 1 M NaCl, 25 mM sodium acetate pH 5.0, 1 mM  $\text{CaCl}_2$ .

The final purification of each correctly folded fusion protein product was then accomplished by gel-filtration into 25 mM NaCl, 10 mM Tris-HCl pH 8, and 1 mM  $\text{CaCl}_2$  followed by ion exchange chromatography on Q Sepharose<sup>TM</sup> Fast Flow (Amersham Biosciences, 1.6 (i.d.) by 20 centimetre column) using a salt gradient from 25 mM NaCl, 10 mM Tris-HCl pH 8, and 1 mM  $\text{CaCl}_2$  to 500 mM NaCl, 10 mM Tris-HCl pH 8, and 1 mM  $\text{CaCl}_2$ .

### ***Example 8***

#### **Cleavage of prepared fusion proteins by GrB-H6, GrB-H6 C228F and FXa**

##### Cleavage of H6-TripUB IEPD↓SP by GrB-H6

The fusion protein H6-TripUB IEPD↓SP (prepared as described in Example 7) eluted from the  $\text{Ni}^{2+}$ -NTA-agarose column was gel filtrated into 100 mM HEPES pH 7.5 and 200  $\mu\text{l}$  samples of the top-fraction was incubated at room temperature with either 0, 1 or 10  $\mu\text{l}$  of activated GrB-H6 (approximately 0, 0.2 and 2  $\mu\text{g}$  GrB-H6).

Samples for SDS PAGE were taken after 12, 19, and 24 hours of incubation, and gels are shown in Figures 4 and 5.

Only the correctly cleaved product appear in lanes C-D in Figure 4 and lanes C-G in Figure 5, and the longer the incubation time, the more cleavage product appears in the lanes, both for the addition of 1 and 10  $\mu$ l GrB-H6. The simple band pattern observed is explained in Figure 6. From this it is clear that GrB-H6 cleaved H6-TripUB IEPD $\downarrow$ SP specifically at a single site. Cleavage at the correct site after the IEPD sequence is confirmed in lane E in Figure 4, where the construct H6-FX-TripUB, containing the FX<sub>a</sub> recognition site IQGR in place of the GrB recognition site IEPD, was cleaved by FX<sub>a</sub> giving a product of the same size as the GrB-H6 cleaved H6-TripUB IEPD $\downarrow$ SP.

The effect of temperature and addition of Ni<sup>2+</sup> and NTA on the cleavage of H6-TripUB IEPD $\downarrow$ SP by GrB-H6

With the H6-TripUB IEPD $\downarrow$ SP fusion protein the following nine incubations (Table 9) were set up using 200  $\mu$ l H6-TripUB IEPD $\downarrow$ SP and 5  $\mu$ l GrB-H6 (approximately 1  $\mu$ g GrB-H6) for each incubation.

Table 9:

1	No addition	23°C
2	4.2 mM Ni <sup>2+</sup>	
3	4.2 mM Ni <sup>2+</sup> + 5 mM NTA	
4	No addition	37°C
5	4.2 mM Ni <sup>2+</sup>	
6	4.2 mM Ni <sup>2+</sup> + 5 mM NTA	
7	No addition	42°C
8	4.2 mM Ni <sup>2+</sup>	
9	4.2 mM Ni <sup>2+</sup> + 5 mM NTA	

Samples for SDS PAGE were taken after 2, 7 and 22 hours of incubation, see Figures 7, 8 and 9.

It was contemplated that the  $\text{Ni}^{2+}$  ions would bind the N-terminal hexa-His tail (H6) of the fusion protein and facilitate access to the cleavage site recognized by GrB-H6. In addition the  $\text{Ni}^{2+}$  ions would also bind the C-terminal hexa-His tail of the GrB-H6 construct. The addition of NTA was made to shield the  $\text{Ni}^{2+}$  ions in solution in a similar fashion as on the  $\text{Ni}^{2+}$ -NTA agarose beads, i.e. to simulate the conditions on the  $\text{Ni}^{2+}$ -NTA agarose column.

Figure 7 shows the incubations at 23°C, figure 8 at 37°C and figure 9 at 42°C. When no  $\text{Ni}^{2+}$  or NTA was added, the H6-TripUB IEPD↓SP fusion protein was cleaved similar to what is seen in Figures 4 and 5, though after 22 hours it seems that incubation at 37°C is the most optimal of the three temperatures tested.

With the addition of 4.2 mM  $\text{Ni}^{2+}$  some protein precipitated at the higher temperatures of 37°C and 42°C, but no precipitation was seen at 23°C. Because of this no further cleavage of the fusion protein is seen in the gel after 2 hours incubation at these two temperatures, where it seems that both some H6-TripUB IEPD↓SP and GrB-H6 precipitated. At 23°C more fusion protein was cleaved after 22 hours than with no addition of  $\text{Ni}^{2+}$ .

The observed precipitation problem was eliminated by the addition of 5 mM NTA to the incubations. After 22 hours of incubation at 23°C more fusion protein had been cleaved than with no  $\text{Ni}^{2+}$  or NTA addition, so the addition of  $\text{Ni}^{2+}$  and NTA seems to speed up the cleavage reaction. By further increasing the temperature to 37°C and 42°C an even greater increase in the rate of cleavage is seen. After 22 hours of incubation at 37°C almost all the fusion protein was cleaved to the correct product. A little less was cleaved at 42°C after 22 hours.

Comparing the rate of cleavage initially estimated in the experiments shown in Figures 4 and 5, to the rate of cleavage observed here, it is clear that the addition of  $\text{Ni}^{2+}$  and

NTA as well as the incubation at 37°C dramatically speeds up the specific cleavage of H6-TripUB IEPD↓SP by GrB-H6.

#### Cleavage of H6-IEPD-RAP by GrB-H6

The fusion protein H6-IEPD-RAP (prepared as described in Example 7) eluted from the Ni<sup>2+</sup>-NTA-agarose column was gel filtrated into 100 mM HEPES pH 7.4 and 200 µl samples of the top-fraction was incubated at room temperature with either 0, 1 or 10 µl of activated GrB-H6 (approximately 0, 0.2 and 2 µg GrB-H6). Samples for SDS PAGE were taken after 5, 23 and 26 hours of incubation, see Figure 10.

After only 5 hours incubation with either 1 or 10 µl GrB-H6 as described above all the H6-IEPD-RAP was cleaved to give the final product. It is also clear that there is at least one internal cleavage site in RAP, but this internal site was cleaved much slower than the IEPD sequence, though. That GrB-H6 cleaved off the H6 correctly at the IEPD sequence can be seen by comparing the size of the product with purified samples of H6-FX-RAP cleaved partly (lane H) or completely (lane I) by FX<sub>a</sub> to give the final RAP product. In these lanes the degradation products from any internal cleavage by FX<sub>a</sub> had been removed by purification.

#### Comparison of H6-IEPD-RAP cleavage by GrB-H6 and H6-IEGR-RAP cleavage by FX<sub>a</sub>

The cleavage of H6-IEPD-RAP by GrB-H6 was compared with the cleavage of H6-IEGR-RAP by FX<sub>a</sub>. Both H6-IEPD-RAP and H6-IEGR-RAP were in 100 mM HEPES pH 7.4 and the following incubations were set up at room temperature, 23°C, with the protease:fusion protein ratio 1:1000:

1. 400 µl (app. 500 µg) H6-IEGR-RAP + 0.5 µl FX<sub>a</sub> (1 mg/ml) (app. 0.5 µg)
2. 400 µl (app. 400 µg) H6-GrB-RAP + 2 µl GrB-H6 (app. 0.4 µg)

Samples were taken for SDS PAGE after 0, ½, 1, 3, 5, 7 and 27 hours of incubation, see Figure 11.

It is clear that both fusion proteins were cleaved very rapidly by their respective protease. After only ½ hour almost all of the fusion protein had been cleaved to give the correct product for both incubations.

However, for the H6-IEGR-RAP + FX<sub>a</sub> incubation all of the fusion protein had been degraded to give a variety of smaller fragments after 27 hours, and there is no correctly cleaved product left.

In the H6-IEPD-RAP + GrB-H6 incubation degradation fragments are also seen, but not as many as for the H6-IEGR-RAP + FX<sub>a</sub> incubation. There seems to be only one GrB-sensitive site in RAP out of 19 possible sites (19 Asp residues in the RAP product), while there are several FX<sub>a</sub> sensitive sites (26 possible sites, 26 Arg residues). This slows down the degradation of H6-IEPD-RAP by GrB-H6, whereby quite a lot of correctly cleaved product (app. 25 %) is still present after 27 hours of incubation.

In summary the correct cleavage of the RAP fusion protein by GrB-H6 is just as fast as by FX<sub>a</sub>, but the degradation of the RAP fusion protein by GrB-H6 is much slower than the degradation by FX<sub>a</sub>. In this example the GrB-H6 protease is therefore superior to FX<sub>a</sub>, and it shows that GrB-H6 is a very specific protease.

#### Comparison of H6Ubi-IEPD-ApoA1 cleavage by GrB-H6 C228F and H6Ubi-IEGR-ApoA1 cleavage by FX<sub>a</sub>

For the cleavage reactions of H6Ubi-IEPD-ApoA1 + GrB-H6 C228F and H6Ubi-IEGR-ApoA1 + FX<sub>a</sub>, the protease:substrate ratio was again 1:1000, and they were carried out at 23°C in 100 mM HEPES pH 7.75:

1. 250 µl (app. 400 µg) H6Ubi-IEPD-ApoA1 + 0.4 µg GrB-H6 C228F
2. 250 µl (app. 350 µg) H6Ubi-IEGR-ApoA1 + 0.35 µg FX<sub>a</sub>

Samples were taken for SDS PAGE after 0, 1, 3, 6, 24 and 48 hours of incubation at 23°C, see Figure 12.

The GrB substrate, H6Ubi-IEPD-ApoA1, is approximately 100% cleaved after only 6 hours incubation at 23°C, whereas only a small fraction of the FX<sub>a</sub> substrate, H6Ubi-IEGR-ApoA1, has been cleaved after 6 hours. It is also seen that FX<sub>a</sub> requires more than 48 hours to complete the cleavage of the FX<sub>a</sub> substrate.

In the above two examples both the GrB-H6 and the GrB-H6 C228F protease is, as mentioned, superior to FX<sub>a</sub>, since it either cleaves much faster (in the case of H6Ubi-X-ApoA1) or more specific (in the case of H6-X-RAP) than the purified, bovine FX<sub>a</sub> (where X denotes the recognition sites IEPD or IEGR). With these two examples it is demonstrated that GrB-H6 and GrB-H6 C228F can both cleave off a short N-terminal tag like the hexa-His tail (the H6 in H6-IEPD-RAP) and cleave between two protein domains which are very closely connected by a short linker sequence comprising the GrB cleavage site adjacent to the polypeptide of interest (here the ApoA1 in H6Ubi-IEPD-ApoA1, with the linker sequence GGSIEPD, wherein IEPD is the GrB recognition site). It was verified that GrB-H6 and GrB-H6 C228F produced the correctly cleaved products by N-terminal sequencing in both the above cases.

#### Cleavage of H6-IEPD-TN123 by GrB-H6

The fusion protein H6-IEPD-TN123 (prepared as described in Example 7) eluted from the Q Sepharose was after final purification gel filtrated into 100 mM HEPES pH 7.5, and 200 µl samples of the top-fraction was incubated at room temperature with either 0, 1 or 10 µl of activated GrB-H6 (approximately 0, 0.2 and 2 µg GrB-H6) both with and without 5 mM CaCl<sub>2</sub> present. Samples for SDS PAGE from the incubations without CaCl<sub>2</sub> were taken after 12, 19 and 24 hours as well as 5 days of incubation. See Figures 4, 5 and 13. Samples for SDS PAGE from the incubations both with and without CaCl<sub>2</sub> were taken after approximately 20 and 48 hours of incubation, see figure 14.

*Without Ca<sup>2+</sup>:*

The samples showed a distinct band pattern when H6-IEPD-TN123 was cleaved by GrB-H6 with no Ca<sup>2+</sup> present, as seen in Figures 4, 5 and 13. The H6-IEPD-TN123 was cleaved correctly at the IEPD sequence, but also just as rapidly at an internal site of the sequence AQPD. The band pattern is explained in Figure 15. That H6-IEPD-TN123 was cleaved at the correct IEPD↓ site can be seen from lane J in Figure 4, where murine H6-FX-TN123 had been cleaved by FX<sub>a</sub> giving a product of the same size as the product from GrB-H6 cleavage of H6-IEPD-TN123 with no internal cleavage, i.e. the lowest band of the four bands in the pattern.

When the samples were reduced as in lanes B-D and L-N in Figure 13 a different band pattern appears. This pattern is also explained in Figure 15 and supports the notion of the specific internal cleavage site AQPD.

*With Ca<sup>2+</sup>:*

Figure 11 shows incubations of H6-IEPD-TN123 with GrB-H6, where 5 mM CaCl<sub>2</sub> were added to some of the incubations. Here only two bands appear when Ca<sup>2+</sup> is present (lanes E and G), while four bands appear when no Ca<sup>2+</sup> is present, as described for Figures 4, 5, 13 and 15. This shows that by adding Ca<sup>2+</sup> to the incubation the internal cleavage site AQPD in Tetranectin (TN123) can be made inaccessible to GrB-H6. This is because the AQPD sequence is located in a loop, where the Q and D residues participates in the binding of Ca<sup>2+</sup>-ions in Tetranectin. Thereby only the correct cleavage at the specific IEPD site in the fusion protein occurs, and the internal cleavage site in TN123 is "turned off" by the addition of Ca<sup>2+</sup>.

Cleavage of H6-TripUB variants

Each of the fusion proteins eluted from the Ni<sup>2+</sup>-NTA-agarose column were gel filtrated into 100 mM HEPES pH 7.4 and fractions of approximately the same concentration of the five different H6-TripUB variants were used. The five variants were H6-TripUB IEPD↓SP, H6-TripUB IQAD↓SP, H6-TripUB IQAD↓SG, H6-TripUB VGPD↓SP and H6-TripUB VGPD↓FG. Of each fusion protein 200 µl was incubated at room temperature, 23°C, with 5 µl of activated GrB-H6 (approximately 1 µg GrB-H6). The protease:fusion

protein ratio was thereby 1:500. Samples for SDS PAGE were taken after 2, 6, 24 and 48 hours of incubation and gels are shown in Figures 16 and 17.

In Figure 16 are shown the samples of H6-TripUB IEPD↓SP, H6-TripUB IQAD↓SP and H6-TripUB IQAD↓SG. After 48 hours incubation approximately 2/3 of the original amount of non-cleaved H6-TripUB IEPD↓SP had been correctly cleaved. In comparison the cleavage of the sequence IQAD↓SP, though, was much slower than cleavage of the IEPD↓SP sequence in H6-TripUB IEPD↓SP. No product is visible after 2 hours incubation and only a small amount had been cleaved after 48 hours incubation. From the H6-TripUB IQAD↓SG samples it is evident that the cleavage was much faster than for both H6-TripUB IEPD↓SP and H6-TripUB IQAD↓SP. Already after 2 hours incubation the majority of the fusion protein had been cleaved to give the correct product. The single mutation of Pro (P) to Gly (G) in the P2' site in the recognition sequence was enough for this dramatic change in the cleavage rate.

In Figure 17 are shown the samples from the H6-TripUB VGPD↓SP and H6-TripUB VGPD↓FG incubations. The cleavage of the VGPD↓SP sequence was almost as fast as for H6-TripUB IEPD↓SP in Figure 16. A small amount of product had formed after 2 hours and approximately half the amount of fusion protein had been cleaved after 48 hours. A dramatic change in reaction rate occurred when the P1' and P2' sites were changed from SP to FG in H6-TripUB VGPD↓SP. After only 2 hours incubation all the fusion protein had been correctly cleaved.

Figure 18 shows the samples of the cleavage of H6-TripUB IEPD↓TQ and H6-TripUB IEPD↓IV compared to H6-TripUB IEPD↓SP. The two constructs H6-TripUB IEPD↓TQ and H6-TripUB IEPD↓IV are deletion mutants of the Trip part of H6-TripUB IEPD↓SP, where the first 7 residues are deleted in H6-TripUB IEPD↓TQ and the first 13 residues deleted in H6-TripUB IEPD↓IV.

Here the protease:fusion protein ratio was also 1:500, and the reactions were performed at 23°C. Samples for SDS PAGE was taken after 4, 24, and 96 hours of incubation.

From the gel shown in Figure 18 it is clear that the cleavage of both H6-TripUB IEPD↓TQ and H6-TripUB IEPD↓IV is much faster than for H6-TripUB IEPD↓SP. As is shown in the following Figure 19 this may be because of the Pro in the P2' site of H6-TripUB IEPD↓SP.

Figure 19, Panel A shows the cleavage of H6-TripUB IEPD↓SP and H6-TripUB IEPD↓EP, while Panel B shows the cleavage of H6-TripUB IEPD↓EP and H6-TripUB IEPD↓EG. Here the protease:fusion protein ratio is again 1:500 and the cleavage reaction mixes were incubated both at 23°C and at 37°C. For the gel in Panel A samples for SDS PAGE were taken after 0, 4, 24 and 48 hours, and for the gel in Panel B after 0, 6, 24 and 50 hours.

From these gels it is clear that a Pro in the P2' site is disadvantageous for the rate of cleavage by GrB-H6 C228F. A surprise, though, is that the GrB-H6 C228F is able to cleave the substrate containing the IEPD↓EP site. It cleaves this site with the same low efficiency as the IEPD↓SP site, but an acidic residues like Glu (E) in the P1' site is infamous for abolishing cleavage by most serine proteases, for example purified, bovine FX<sub>a</sub>.

If we now consider the P1'P2' sites of IEPD↓SP, IQAD↓SP, IQAD↓SG, IEPD↓EP, and IEPD↓EG it shows that the change in the P2' site from Proline to Glyine enhances the cleavage dramatically. This preference for G in the P2' position was also found by Harris JL et al., 1998 for wt rat GrB using peptide substrates displayed on phage particles. Again GrB-H6 C228F shows a surprisingly effective cleavage of at the IEPD↓EG site in spite of the E in P1', which is, as mentioned above, is well-known in the art for obstructing cleavage by most serine proteases. At a protease to substrate ratio of 1:500 it takes less than 5 hours for GrB-H6 C228F to complete the cleavage of H6-TripUbi IEPD↓EG. In this respect the GrB-H6 C228F is again superior to FX<sub>a</sub>.

In addition to these observations it is also important to note that even after 48 hours incubation with GrB-H6 or GrB-H6 C228F no internal cleavage took place in any of the H6-TripUB variants, showing that GrB-H6 and GrB-H6 C228F cleaves very specifically

at the engineered recognition sites, even though the TripUB sequence contains 7 other Asp (D) residues.

### **Example 9**

#### **Immobilization of Granzyme B**

In order to be able to easily remove the Granzyme B enzyme from the cleavage mixture the GrB-H6 C228F variant was used for immobilization onto a gel matrix in six experiments as described in the following.

The immobilization was performed in 0.3 M NaHCO<sub>3</sub>/NaOH, pH 8.6 using the divinyl sulfone activated matrix called Mini-Leak (Kem-En-Tec). Two levels of activation were used; 2-5 millimoles and 10-50 millimoles vinyl groups per litre sedimented beads, respectively, and for each level of activation three experiments with different protein concentration and with or without PEG 20000 present was performed. The six experiments are summarized in Table 10. For the immobilization GrB-H6 C228F in 0.3 M NaHCO<sub>3</sub>/NaOH; pH 8.6 was used at a protein concentration of 4 mg/ml, as estimated from a Bradford assay using bovine serum albumin as protein standard. The enzymatic activity of the GrB-H6 C228F solution was measured as described example 4 using the buffers 0.3 M NaHCO<sub>3</sub>/NaOH; pH 8.6 and 30 % PEG 20000; 0.3 M NaHCO<sub>3</sub> as assay buffers. The immobilization was performed by mixing drained gel, protein solution, and buffers to provide the volumes and concentrations listed in Table 10 followed by mixing at room temperature for 48 hours.

Table 10:

Experiment	Activation level (mM)	Protein concentration (mg/ml)	% PEG 20000	Efficiency (%)
A	2-5	0.75	0	10
B	2-5	0.75	9	18
C	2-5	2	0	10
D	10-50	0.75	0	16
E	10-50	0.75	9	10

Excess active groups were blocked by addition of 600  $\mu$ l 0.2 M ethanol amine, pH 9.0 after draining the gel by centrifugation and removal of the supernatant, followed by mixing at room temperature over night. Non-bound protein was removed by washing the gel three times with 1 M NaCl (centrifugation followed by removal of the supernatant) and finally the gel was washed with 250 mM NaCl; 50 mM Tris-HCl, pH 8.0. The enzymatic activity of the immobilized GrB-H6 C228F was estimated by weighing out drained gel matrix, mixing with 300  $\mu$ l of a substrate solution containing 100 mM HEPES, pH 7.75; 400  $\mu$ M Ac-IEPD-pNA (Calbiochem) and then measure  $OD_{405\text{ nm}}$  of the supernatant after a certain time of incubation to determine  $\Delta OD_{405\text{ nm}}$ /min per ml of substrate solution per g of drained gel. The enzymatic activity of immobilized GrB-H6 C228F was used to determine the coupling efficiency as a percentage of the calculated enzymatic activity if all applied enzyme was coupled and active.

The coupling efficiency is also listed in Table 10, and there is no significant difference in coupling efficiency between the two activation levels and the efficiency is also within the same range for the two protein concentration, so the highest coupling level is obtained when using a high protein concentration in the immobilization mixture. It can not be deduced whether addition of PEG 20000 to the coupling mixture is favourable for the immobilization and it was not evaluated for the high protein concentration.

The stability of the immobilized GrB-H6 C228F against denaturation with urea and guanidinium chloride (GdmCl) was determined for the two immobilizations with high protein concentration (experiment C and F). The gel matrix from experiment C and F was each aliquoted into three small spin columns and incubated with either 8 M urea; 0.5 M NaCl; 50 mM Tris-HCl, pH 8.0 (Urea), with 6 M guanidinium chloride; 50 mM Tris-HCl, pH 8.0 (GdmCl), or with 100 mM HEPES, pH 7.75 (HEPES) for 30 minutes at room temperature before it was washed and equilibrated in 100 mM HEPES, pH 7.75. The enzymatic activity of the immobilized GrB-H6 C228F was then determined as described above.

The enzymatic activities obtained are shown below in Table 11. Denaturation with urea seems to be favourable for the immobilized GrB-H6 C228F as the enzymatic activity is increased after incubation compared to incubation with the non-denaturing HEPES buffer, whereas denaturation with guanidinium chloride seems to have an effect that slightly decreases the enzymatic activity.

Table 11:

Experiment	Buffer	Enzymatic activity <sup>a</sup>
C	Urea	99
	GdmCl	89
	HEPES	91
F	Urea	104
	GdmCl	78
	HEPES	90
<sup>a</sup> $\Delta OD_{405}$ /min per ml of substrate solution per g of drained gel		

Functionality of the immobilized GrB-H6 C228F was demonstrated by cleavage of the fusion proteins H6-TripUB IQAD↓SP and H6-TripUB IQAD↓SG prepared as described in Example 6. Cleavage experiments were performed with 50  $\mu$ l of each gel matrix from the six immobilization experiments. The gel matrix was re-suspended in 200  $\mu$ l of a buffer containing 100 mM HEPES, pH 7.75, and was incubated with 100  $\mu$ l protein solution of each of the two fusion proteins at room temperature over night with shaking. Samples of the supernatant were withdrawn and analyzed by non-reducing SDS-PAGE, see Figure 20.

For all twelve cleavage experiments the fusion proteins are cleaved to give a single product corresponding to TripUbi moiety from which the H6 fusion partner has been cleaved off. As expected, slightly more fusion protein is cleaved by the gel matrix from experiment C and F that should have the highest coupling levels. The cleavage efficiency was not evaluated.
